Hi,

Graphic shell for dosfsck (a tool for repairing FAT, FAT32 and
VFAT partitions) is now available at
http://gregory.atari.pl/dosfsck-shell.htm

System requirements: ASH Scripter
Jinnee
MagiC (although it works with MiNT as well)
FORM.PLG (included in the package)
dosfsck.ttp (included in the package)

As I have promised several days ago, a hypertext manual for the shell
(dosfsck.hyp) is also included in the package. The shell script
is public domain, do whatever you want with it.

> colour or religion :-)

GNU apps are Unix tools, and require losts of things tha SingleTos is
lacking, thus porting it to SingleTos would be extremally hard in some cases
(and easier in some). As for MagiC it has almost all FreeMiNT features and
most of GNU software that runs under FreeMiNT should run under MagiC too.

GNU programs are written with portability in mind, but OS must can do some
things that SingleTos is lacking. Sorry. Not our fault.

> Hey... the pot is calling the kettle names now!! I didn't say that those guys
> aren't good programmers, it's Frederic, Adam, Lonny and even you who told me
> so... oh, and I didn't call anyone a moron either.

I've never questioned anyones programming abilities. I just said that some
ideas (protocols) that you find so useful (and thewy are usefull indeed) and
so wonderfull, are not that wonderfull (especially from OS developper point
of view).

> Do you call that a manual? have you ever seen a *real* manual? suppose I'm a

I wouldnt call Unix (Linux) lovers a small ammount of people... there are about 5mln desktops running Linux.

If you count FreeMiNT among unices, then you count me as creator of disortion filed.

Let me explain WHY Unix-like systems (and FreeMiNT) are better then others:
- lots of them (most) are FREE
- they are based on well developed philosophy, created at places like MIT, Berkley and few others
- sourcecodes avialible

FreeMiNT comines both: the strentdh and tradition of Unix and the Atari feeling.

Oh, did I just started another OS war? ;)

ASH wrot lots of usefull preogram for Atari platform. For that, I'm very
gratefull for ASH.

But ASH also did some unwise decisions: why they wasted mone/time for their
own internet stack? Their stack supports modem connections only and molst of
newer ASH software exists in two versions: for their stack and for another
one (do not remember name atm).

> Even if it was commercial it wouldn't make any difference, take a look at all

> was supposed to... etc.

Any CLEANLY written app, that uses WELL DOCUMENTED OS functions and does not
make mess in the memory WILL WORK under FreeMiNT.

Calamus is one of best software packages ever created for our platform, but
it was Calamus fault that it didn't worked under FreeMiNT. Morover Calamus
was fixed to work under FreeMiNT not FreeMiNT to allow Calamus work.

As you do anything that even remotely smells on MiNT! I politely
explained to you, that MiNT basicaly runs all Magic does and still regain
true Atari feeling, but ** BESIDE ** that (NAES/THING or Jinnee) envoirment
there us true Unix like envoirment (which u dont need to enable at all!)
with BIG library of tools, a lot of those usefull to us (camera stuff,
dosfsck etc etc..) Also the real Atari apps can also use SOME (not all) of
Unix resources, network aka mintnet for example.. I wont go deep again, so
u wont again say i only tell net stuff, but SSL layer for CAB is actualy
very usefull... Yours reply on all that are known and i will NOT comment
them...

> As explained in previous posts I have nothing against these apps themselves,
> but anyone proclaiming that these apps are just what we've been waiting for
> needs his head examined. Whatever is left of this platform will be scared away
> when seeing what that group has in mind...

And what we have in mind? A free OS, with a smell of Unix, which dont
kill Atari. I still dont understand how that may hurt Atari! If someone
port Unix CLI app for personal or any other reason this does NOT hurt
anyone, 2 reasons:

1. there is a tool which didnt existed so thats a bonus. If its a bit
quirky to use it aint the end of the world.
2. it dont prevent anyone to live without it further.. its not, to use
your words, "showed into anyones ass"

> Depends... if a black jew would port a GNU app, don't go through the trouble

> colour or religion :-)

Yes, u are a GNU racist.. If its not Magic, it sux.. period. If its GNU
then it sux double! I for example DO have Magic, and even use it from time
to time... U just wont understand, that ported apps to Mint Unix
envoirment are not ported to Atari OS. And last but not least: ALL u do is
complaining, DO something instead. Like Gregory did and u now have a shell
for dosfsck. But u just bash anything thats not to your likings.. How the
hell a guy had guts to port an application and dont even consider your
egoistic requests? Bash him! I use all what works for me, GUI, CLIm
german/english/spanish, no matter.. if i have to type more, or learn a
word or two, so what?

> >>You want us to return to the stone age, the only reason given for this so

Well then not capable, killers of the platform etc, etc..

> Do you call that a manual? have you ever seen a *real* manual? suppose I'm a
> newbie? About once a week there's a posting here from someone asking help

> Atari tradition.

Yes i do.. But ill emphasise again: In unix manual is what is located in
"man/" folderm not "readme" or "readme.mint". Gregory did nice job to make
that "hyp" but all that is actualy taken from "man" pages located in
dosfsck package. Again, instead of bashing all over, u could do that in
few mins....

> Oh Janez.... are you a stand-up comedian?

I may be. After all i dare to think diferent as you...

> Linux, NetBSD, PPCLinux etc.... have been here for years, all what's really
> happening is that some Unix lovers make a little more waves then they used to,
> the fact remains that these OS's remain unpopular and are only used by a very

> create a distortion field.

Well oki then, i wont distort u any more.. But using MiNT or Magix is
not a matter of being real or bad Atarian, is more like using Papyrus or
Signum... Other way to achive the same... As i said, u won the case i wont
disturb u any more...

> As for OS X.... that's something Apple is trying to shove up the a*** of Mac
> users, so far with limited success. Open your eyes, the majority of the Mac
> users still use OS 9.x, have you ever wandered why? Adobe just released

> PhotoShop 7.0 and just like most of the other Mac power apps it's *not* OS X
> compatible....

Main reason for not getting OS X by a lot of ppl i know is actualy
hardware requirements! And also Apples idiotism to make OS on which most
of old apps doesnt run.. Parallel with MiNT is, that MiNT developers care
a lot for Atari apps and realy the minimum of those dont run, with memory
protection off there is very small ammount of unhappy apps. But u can find
those with any OS. MiNT is maybe more touchy as other OS-es, but still a
LOT of apps does run fine...

I'm using Calamus since the early days. I never encountered a Calamus
version which didn't work properly under MiNT. Even the so dreadfull
SL99 version worked.

Hi All

This is just a quick note to say THANK YOU to Atari-Source (http://atari-source.com) for supporting the Atari MIDI community and also posting my little news items on their web site. To be honest, I never knew anybody read those as I get little feedback, so I was quite surprised when I saw my news items on their site.!!!

So a BIG THANKS for the wonderful job they are doing for MIDI as well as all the other interests of Atarians everywhere. We are a unique bunch!

Tim,

You are very much welcome. I am taking a keen interest in MIDI and computer music in general and at the same time know what kind of work it is to produce the results that you are producing. I feel that what you are doing for the community is just as noteworthy as even the best piece of code. I can only believe that there are other people out there like me who have Atari's but do not know much about MIDI who would like to. Your pages are informative and helpful, very much so in fact. Keep up the good work, Tim!

Thanks
Mark

Talking of MIDI ..... I have a Yamaha DX11 keyboard - kind
of a cut-down DX7. It is only 8 note poly and when I've used
it for MIDI I kept getting MIDI overflow errors. I tried
various programs back when they had cover disks so don't
recall what worked best.

What I'd like to know is what program you think would work
best with a DX11 ? (I've got both a STfm and STe).

Newsgroups are for sharing experiences and help each other. If you stick
to that you will get very few offensive follow-ups.

So far I have not seen _any_ posts in this thread that claim I'm wrong.

As for bashing I personally find it pathetic when not having the other
person in front of your eyes... And, if someone hits you, _never_ use
any Atari equipment when you strike back. Only light pc notebooks should
be used if you forgot to bring your handbag with you :-)

Dear Atari fans,

I am the editor of the free monthly Atari magazine, MyAtari and I was wondering if there are any Atari fans out there up to the challenge of writing a monthly/bi-monthly column for MyAtari magazine?

It can be about anything Atari related such as reviews of hardware / software (inc. games) or articles about your favourite Atari web site. Maybe you have years of experience programming your ST or repairing and upgrading consoles...

If you would like to pass on your years of knowledge and expertise to thousands of Atari enthusiasts a month, we want to hear from you!

If you are interested or would like further information, please get in touch!

Same here, I don't think any rev needed it. I guess it was
something like Atari wanting to make a new keyboard, but then
decided to spray paint old ST keyboard stock and just use them :)

Hi Steve

If you are talking about an editor, I would recommend the Caged Artist
editor called 4 Op Deluxe, and deluxe it is, also the YS editors
(Martins site)I am sure it work with a DX-11(Martin, can you varify?)
see my Caged Artist page on my site

http:://tamw.atari-users.net

Now if you are talking about a sequencer, that is a different matter.
Even with one voice, you can still have fun. Try Dr T's KCS,
Real-Time, Edit Track, ect. There are many on my site.

Tim

Hi Mark...thanks for responding. Even if you are not a musician, you
can still play around with the algorithmic generators for some great
fun,(M, SB5, MidiGen, Music Mouse, ect) and all you need is a simple
MIDI module to connect to the ST: you don't need an interface!
Thanks again for your support!

Hi Adam,

>But ASH also did some unwise decisions: why they wasted mone/time for their
>own internet stack?

Today it might seem to be an unwise decision, but it wasn't in december 1995
when development of IConnect started. At that time there were only two popular
stacks: MiNTNet for MiNT and STIK, STIK could only handle SLIP connections and
since PAP was the new kid in town... I'm not even sure if at that time MinTNet
supported PAP.... but that's beside the point. IConnect was the first stack
that allowed Magic users to connect via the PAP and SLIP protocol, it could
also handle ISDN which at that time was very popular in Germany. STiNG allows
PAP also, but it only came a year later...
What really messed up the plans of ASH was the Milan, if the Milan would have
been the success that anyone envisioned it would be, then things would have
looked quite different now.

>Their stack supports modem connections only

IConnect was designed to be a dialup connection only stack, this has always
been the big argument against it here... but there are people around who don't
put their Atari in a network and/or don't have access to cable or DSL either.
For these people the "modem only" argument is no argument at all.

Cheers from Belgium
Dennis

Hi Janez,

>And last but not least: ALL u do is complaining, DO something instead. Like
>Gregory did and u now have a shell for dosfsck. But u just bash anything thats
>not to your likings...

But it payed if off didn't it? :-)

If me shouting, sulking and complaining here results in someone turning a for
many people usefull but unfriendly and rudimentary app into a program which
even a newbie can use, well, then I'm prepared to turn CSAST and the whole
Atari community upside down everyday. The reasons why dosfsck has a Gem front
now aren't important. Far more important is that this application from now on
will be used by a lot of more users then ever before...
...and if I'm not mistaken that's the ultimate goal of GNU software?

>How the hell a guy had guts to port an application and dont even consider your
>egoistic requests?

True, now that dosfsck has been fixed, I'll have to zoom in on another target,
just watch this space <grin>

Cheers from Belgium

It IS an argument, but in favour of IConnect. Sometimes it can be a big
advantage if an app cannot do all those things that you don't need anyway.
Can make life a bit easier. Sometimes less is more. (And I'm not even
referring to the unix apps this time ;-)

U realy dont get it really? Again, how hard is to doubleckick DOSFSCK.TTP
and type "-a D:" into TTP comand dialog box??? I dont know if u wana make
us look stupid or yourself.. U keep talking bout unfriendly and complicated
app, etc and all it need is 4 characters! What is easier if u use GUI? U
still need to click on automatic repair (-a) option and a drive u want to
check (X:). U really need to do absolutely the same i both cases...

And btw, u don's sulk or complain... U bash all and everyone which u
dont like.. Look at this thread, its started since someone ported an
application, which didn't exist before on Atari. Of course u had a problem
and u extend that to all GNU/CLI software. U went so far that u call MiNT
ppl and ppl who port stuff (non exisiting stuff, and dosfsck is NOT a
network app!) killers of the platoform, comunity who drive ppl away..

> now aren't important. Far more important is that this application from now on
> will be used by a lot of more users then ever before...
> ...and if I'm not mistaken that's the ultimate goal of GNU software?

Well now u contradict yourself.. U actualy meant to use an application
of Unix origin? Ported and thus Atari platform killer? That app still dont
recognize the protocols u like so much and u clearly stated what u think
about those apps. Wont that thread your Atari feeling? It is clear that
CLI Unix apps does only make Atari better if used in a way MiNT does:

No matter if its used in CLI, or as TTP (with or without GUI), point is
that MiNT merge (not replace!) Unix to native OS so well that ported app
(which is basicaly just runned thru GNU C compiler) became proper .TTP app
and thus TOS/MAGIC/XXX friendly!! They are NO threat to Atari feeling
since u can run them as normal TTP apps in TOS, or as CLI/TTP in MiNT and
also your favorite as TTP via GEM Scripter shell with GUI! So maybe u will
rethink again about their bad influence to Atari? And maybe, just maybe u
will realise that WE are on same side as u, and noone want to overflow
Atari with some faceless Unix... Linux make slow Linux box out of Atari,
MiNT on other hand does not. MiNT developers try to preserve Atari feeling
and they do a lot of hard work to achieve that! And we got a big library

of Unix apps paralleling the Atari world.

> >How the hell a guy had guts to port an application and dont even consider your
> >egoistic requests?
>
> True, now that dosfsck has been fixed, I'll have to zoom in on another target,
> just watch this space <grin>

Well why dont u zoom into GEM scripter then? And as backup activity to
DDP offer .SIC files for some of nonexisted and wanted applicatons? This
is not a teasing, its proper proposal. U wont need to argue and bash
anyone and everything, but kinda MAGICize some of tools me and you know
its welcome to Atari community, even as Unix ports...

> away that easily.

While I don't often share Frederic's views, on this point I have to agree.

CLI definitely has its place, even on a GUI-enabled OS like Mac. While old Mac users sometimes grin at the idea, those working in the animation or graphics rendering have been calling it a blessing, because it allows them to script their rendering task exactly like on the SGI hardware they have been using, among other things. Meanwhile, all the usual GUI stuff is still there, only now it integrates well with the UNIX environment, instead of being proprietary MacOS protocols and file formats like before.

On Atari or Linux, the same logic applies and offers freedom of choice. When I'm surfing an FTP site, trying to locate something and copying whole folders, I prefer the comfort of a GUI application like aFTP or gFTP. When I know exactly what I'm doing e.g. when updating my web site, I use CLI tools like ncFTP, SSH or rsync, because those are far more efficient.

***

Funny how the exact same faces are still playing the same flame wars about the exact same topics as before. Surprisingly enough, I don't miss that at all, as not being involved into those pointless circular arguments frees time for more constructive activities.

***

Still, as someone who successfully uses Linux for everything (the TT still makes appearances at demo coding parties, but that's about it), I have to confirm that CLI and GUI both have their place on the desktop. For those who are curious as to what I use nowadays, it's the full Ximian desktop kit on Debian; about as GUI enabled as it gets on Linux (the default configuration looks like a souped-up Atari or Mac desktop), but an X terminal is on my application launcher too as I could not live without it anymore.

So why they didnt asked STiK authoors to improve STiK - IMHO it could be
easier, faster and would offer software compability with STiK clients.

Do you ever think the appropriate thing for you to do would be to kill file everyone and everything you don't like vs flame? It saves a lot of time.

BTW: The financial structure of the internet has changed in the USA. Where as in 1990 you possibly could have complained to Ben's ISP, what he is doing now is perfectly legal if it doesn't violate his TOS with his ISP. This is part of the legislation Al Gore pushed through congress that people wrongly attribute him to saying he "created the internet" vs. "took the legislative lead in congress".

I don't like all the spam, porn, MMF, ad nauseum myself, but the commercialization of the net was exactly what the policos wanted to do and attribute that to the growth of the net. Ben's stuff is really harmless: He uses the same ID and doesn't try to hide behind phony names or defeat filters.

Some time ago, I mentioned some little problem with a HD floppy disk
problem, in detecting the HD hole detect switch. Somebody had met that
problem before and presented a one-transistor addition that would solve
it. If that circuit still exists, I would like to have it, not just
for me to use, since I could work it out for myself, but the hardware
hacks page could use it, and I would like to correctly attribute
the originator, if possible. I am in the process of re-doing one of those
things after a chip died, and I might as well do it right.

Jim

> recall what worked best.

I assume you get this problem from a SysEx dump being sent back to the DX-11... Basically you gotta send it either (a) slower, or (b) in smaller chunks.

I don't know how to do (a)... But to do (b), you basically break the data into say 2 chunks and send them one-by-one... If that doesn't work then try 4 chunks. [On my Yamaha ProMix 01, I had to break it into 8-10 chunks]

You should look in the data for something that looks like ".. .. .. F7 F0 .. .. .." and choose F7 / F0 as the split point (someone correct me if I'm wrong) cos each data chunk must start with F0 and end with F7.

3627. Re: WTB 030 FPU/DSP Chips

Newsgroup: comp.sys.atari.st
Date: 2002-04-22 01:09:04 UTC
From: Glenn <glenn.bruner@verizon.net>
Message-ID: <QoJw8.9655$t65.9641@nwrddc02.gnilink.net>
Source record: 35580

John,

If you're looking for plug in FPU types, try locating an old Mac II or IIx motherboard. They used the plug 16MHz chips. There's a company called Shreve Systems in Louisana that specializes in old Mac parts. I would say the Mac II would be the preferable (and probably cheaper) one to buy.

I restored a Mac II from the dead many years ago. I managed to find a replacement 68882 16MHz for it at a Mac store in San Jose, CA. Paid like $35 for it back in 1993. Mac II computers will not start up without an FPU.

Not sure what to suggest about the DSP chip. I don't know how popular that chip was outside of the Atari computers. Never really seen much electronic boards using them. But then again, I wasn't really looking for them either.

Jim,

Thanks for the information. I do have the diagnostic cartridge (3.5 and 4.3)
, loop back board and the expansion port fixture. I connected the unit to a
vt52 terminal and nothin. So I check it out with a working ST and it worked
great as usual. I guess Ill keep messing with it. Hopefully it doesnt get the
hammer soon!

Thanks again,

Don

In any case when using MagxNet one can use any client one likes with the
supplied gateways, although Vassilis has yet to release the IConnect gateway,
whilst also connected to a network.

Cheers

I always recommend IConnect. It's much, much easier to get going with it than
any of the alternatives, and with IFusion, (most) STiK and STinG clients can
also be used.

Cheers

Hi Glenn (and Pete),
Thanks for the advice. I've ordered both the FPU and DSP ICs from
Wizztronics rather than hunt down and desolder a possibly bad, used chip.
A bit expensive though (sorry Wizz :) but I know they'll be quality items
(got a RAM board from them compatible with Ctirad's PhantomSE) and Steve
is always available to add some info.
Thanks again,
John G.
P.S. Czuba has'nt replied and I was too impatient to wait!

Screw you, you're shocked. I haven't seen a word you've written that wasn't flame bait for a number of years. Read the issue and you'll see the Atari-related articles. I seem to recall suggesting that to you before. You wouldn't know an Atari article if it bit you on the ass. And, just because one doesn't show in the teaser header doesn't mean they don't exist. So why notjust crawl back into your basement and stay there a few years.

If considering your way of bashing the original poster turns a person
into an asshole, you can count me in there then...

This newsgroup is certainly not flooded with commercial postings, so I
don't have a big problem with it. If I OTOH were to react every time a
disrespectful posting is seen, I'd have my hands full complaining. I
guess we all have to let some things pass.. ..and at least try to be
nice. If not, I don't see any reason to stay around really.

I need the HSMODEM software which (I gather) replaces the serial port driver to provide faster speeds.

This software is mentioned in the Quick FAQ as an important component, along with CAB1.5, STinG, and certain other software, to get an ST on the internet. The FAQ has a link for it, but the link is bad. I haven't found it elsewhere.

If you don't know where it can be found, the exact name of the package would give me something better to search with.

Thanks.

From the looks of it, it is a rather interesting discussion of the AtlanTOS and AmigaOne projects (from a "former-" and "non-Atarian/Amiga-an" point of view. However, it quickly degrades into a Windows vs. OSX discussion. :(What can you expect from a Mac site, though!

Believe it or not, it's a pretty good thread.
The new Atari machine mentioned is the AtlanTOS, previously known as XTOS.

hmm yes, there IS a problem to adapt GNU packages. As it goes against the
license if you don't release the new code.
In Anodyne's case, it is a separate binary. So it's ok.

Hey, guess what?
singletos, magic, geneva don't have memory protection. So your point is
not really valid. Any clean application will work on any OS as long as
the OS hosts the necessary calls, and that they are compatible across the
OSes. That's pretty simple.
Singletos, geneva are missing a LOT of calls that magic/mint have.
So there is a difference right there.
Then you can separate further, mint and magic although really close now
with latest versions are still incompatible, some calls like pexec() are
not the same. What is a coder supposed to do? which one is correct?
What documentation should the coder follow?
There are many inconsistancies like that.

Did papyrus follow atari standards for their apps?
I seriously doubt. Making a c-icon toolbar following atari standards is
not that hard, but then, if I remember it looks all weird in magic (with
way too big border 3d effect on the icons)

calamus was a dirty hack (old versions) I don't know about latest though.
But I understand they fixed a lot of things.

>> and never experience any problems with it :-/

Then apparently people have different views what bashing is. I stated I deleted wdialog, that certainly is not bashing. Those who have it working under mint problem free should step forward and explain just how they go about it. I can tell you that on my MiNT system(s) wdialog causes CAB and QED to crash after several startup/exit cycles, at which point nothing that tries to use wdialog will run, one is forced to reboot. This includes phototip, the chances that all 3 of these apps are flawed is remote, the problem seems to come from wdialog. Simple test, remove wdialog and QED and CAB can be started/exited many times without crashing. One can defend wdialog to the end of the earth, it's simply a bad design and one should not have to take steps backwards. That is not bashing either, it's simply the facts.

> I'm missing out on.

Well, you could check http://www.washington.edu/pine/ and see what
features it has.

But in my case and my case only:
I can choose any editor I want (qed, everest, pico, vi, emacs
whatever)
I can read my mail remotely (thanks to the non-gui interface).
pine is available on all platform, that's what I use on all my comps.
More importantly though: it supports IMAP. ASH emailer as far as I know
just does not. That's a BIG seller to me, especially when I don't want to
store email on my machine and when I have 1140 email or so.
Also, I don't know how well emailer would handle 2000 email.
It just works fast and it's very easy to use, cut/paste, search, very good
filters, spell checker, web browser forwarding (of your choice, lynx, CAB,
netscape whatever). There's plenty of stuff I like in pine that are useful
to me. Did I mention it is free, comes with src and is constantly updated?

Oh the bad thing is that I can't have background images in it like emailer
has. I guess I will switch to emailer because I like nice pictures and
screw my IMAP mailbox, I'll just switch to a pop3 account.

....

NOT!

Although I haven't tested it extensively, I've never had much of a problem
using it with any of the OS's I use (including my basic Mint setup). I don't
know why it works for me and not others. I just drop it in the AUTO folder
and away it goes. The only thing I've noticed is that it seems to cause a
minor slow-down in my Mint+Geneva setup.

> Hey, guess what?
> singletos, magic, geneva don't have memory protection.

First, Magic does have a memory-protection version (to make an minor,
insignificant correction). Second, is this why people have trouble with
WDialog? Because it doesn't like Memory Protection? If that's the case,
maybe that's why it works for me. On my Falcon, I can't use a
memory-protected Mint.

Sounds like the authors of Magic and Mint need to have some kind of
discussion about standards...

>> the

>> toolbar contains coloured icons, guess how they they look under MiNT? Ask any
>> Calamus user how long it took before there was a version that worked the way
>> it
>> was supposed to... etc.

That's been one of my complaints about Papyrus to the authors (I'm a betatester), but they didn't seem to see why that would be an issue. I guess it's not as far as functionality, but for me personally, I like a program that isn't just functional, but has a nice-looking, clean, consistent presentation. A lot of Atari software is hugely lacking in that area, I've noticed. Papyrus' icons aren't even completely colored (look at the icons in the help viewer). I've also never liked the interface of Calamus at all. Too much jumbled black and white is visually confusing to the eyes. Nice, color images, with separating borders help you find things much easier in fairly large interfaces like the one in Calamus.

But as you say, to a lot of people, if it works, who needs beauty. Well, for them, that's just fine. But for me, inconsistencies in appearance and general ugliness is enough to really annoy me about a program. I'm just picky that way, I guess.

By the way, if any software designers need someone to edit their RSC files to have a nice, consistent look, drop me an e-mail!

I haven't noticed any problems like that... what exactly do you mean, so I can see the problem, and maybe report it (if you haven't already)?

>> Now brace yourself... tomorrow I'll be flamed from here to eternity, but

I agree. There needs to be a "meeting of the minds" between the authors of the OS's/AES's, and some standards set in stone that everyone follows. Then again, whose standards are the ones to follow? My vote would be the ones that are compatible with the most TOS (not Magic-only or Mint-only) software.

You should be able to use a protected MiNT - a Falcon has an 030
processor, like the TT.

(Or does your Falcon have a 'crippled' 030 (68EC030) that lacks an
MMU?)

Maybe he has a CT2b, like I have ?
I can't use memory protected MiNT 1.15.12 on my CT2b Falcon, unless I switch off the turbomode. I tried MiNT 1.16 and memory protect seemed to work with it, but I experienced too may other problems. So I'll just wait for a stable and official new release.

I tried to compile the 20020417 CVS snapshot version this time (with the official 1.2.4 release of SDL).

> I only had the time to test it under XSteem, where it failed miserably
> :-(I did not even get the command line prompt, but remember that

> with TOS 1.06 with only 1 MB RAM so I did not expect much from the
> try. Time to fire up my Falcon again or install a decent ARanyM setup!
> :-)

I tried it on my (CT2-ed) Falcon this time: the command line part worked OK (I suspected it would :-)...) but I get complains about the SDL library not supporting sound, so the real game does not even get a chance to start.

As of today sound is not yet supported in Patrice Mandin's SDL port. And there is no #define's or whatever in scummvm's sources to build it without sound support. I tried to run it with "-enull" as argument (this is said to disable sound in the docs)... but in fact this option apparently simply outputs MIDI commands to /dev/null! And it seems SDL audio core is needed even for that!

So for now I think the only thing to do is to wait for SDL port to be completed. Perhaps I will ask Patrice if he could implement a basic (i.e. fake) audio support as a start. And I will look further in the sources if SDL audio core could be made *really* optional...

Back to the topic at hand.

I have just received product from Bravo Sierra and it was in excellent
condition and exactly what I asked for and the shipping was very reasonable.

The Chapelie ftp server is the best place to look for such.

You might also be interested in the English docs for HSModem, which are
available for download from my web site.

Cheers

I'd rather see some of those hideous dialog boxes tidied up, would also be nice to see the shortcuts assigned to a letter in buttons - leaving the underline under the first character when the actual text starts a few places in doesn't really cut it these days. And when is the Atari version of Papyrus 9 going to be released?

>the help viewer). I've also never liked the interface of Calamus at all. Too
>much jumbled black and white is visually confusing to the eyes. Nice, color
>images, with separating borders help you find things much easier in fairly
>large interfaces like the one in Calamus.

Agreed in general, but the manual recommends several times that Calamus is best controlled by macros, which can be recorded and assigned to hotkeys at will and saved to disk for re-use.

Cheers

Message-ID: <3cc53edb$0$220$4d4ebb8e@news.nl.uu.net>
Source record: 35518

Hi all,

I'm looking for a way to download the ST Format cover disks images somewhere. I found a site, http://dewey.ecs.soton.ac.uk/stformat/ ,but I cannot download anything there because the server always times out, for some reason.

If anyone knows of (an) alternative(s), please let me know. Better yet: if you have these on CD and want to sell or swap them (I have most automation menu's on a CD), please post a message or contact me.

Regards,
Wef

Hi Adam,

>So why they didnt asked STiK authoors to improve STiK - IMHO it could be
>easier, faster and would offer software compability with STiK clients.

I've no idea... way back in '95 this probably wasn't even an issue, ASH is
a software distributor, when Sven Kopacz presented the first betaversions
of IConnect and CAB.OVL to them, I think they just jumped on it.
Not being compatible with STiK probably was the last thing on their mind.
There weren't that many STIK clients around in '95 and most of them sucked
anyway, and I suppose that at that time beta versions or plans for clients
like Fiffi, Emailer etc... were already on the table as well.
Another thing to remember is that way back in '95 a lot of people weren't
on the internet yet, for getting hold of information or new releases most
of us relied on Atari magazines. Most of these magazines didn't do a very
good job as far as PD-sofware was concerned. In the German magazines the
very little PD software that received some exposure was from German origin,
it wouldn't surprise me one little bit that Sven Kopacz wasn't even aware
that STIK existed when he developed IConnect.
I went on the internet late in '97, and that's when I first heard anything
about freeMinT and MinTNet, until then my only experience with freeware or
shareware came mainly from disks attached to a magazine or from crap bought
at silly prices from public PD libraries.
Just think back.... I'm not an exception, most of us were in that boat...

Cheers from Belgium
Dennis

Hi janez,

>And btw, u don's sulk or complain... U bash all and everyone which u
>dont like.. Look at this thread, its started since someone ported an
>application, which didn't exist before on Atari.

This thread was started by Mark Duckworth who questioned nearly everything I value about this platform in his posting. I didn't react to it immediately, but upon seeing follow-ups that actually supported his silly views I just had to step in...
Let's not go over his whole silly post again, but focus on what set the GNU apps discussion in motion:

<SNIP>
>For each pay product out there, chances are there's a free product that's
>as good or better.

Really? where are these wonderfull programs that are just as good as Papyrus, Calamus, CAB, Photoline, Texel, Phoenix database, Coma, Aniplayer, PhotoTip, Jinnee, Thing, Papillon, Porthos, Tempus Word Pro, N.AES, NVDI, Cubase, Notator, CD Recorder Pro, CD Writer Suite, ExtenDOS, Artworx, Arthur, Luna, Egale, ASH Scripter, GFA Basic, RSM, Papillon *AND* last but not least HDDriver... to name just a few.
Name me just *one* single application that is just as good or even better and costs nothing, if you can, I promise to put a sock in my big trap for the rest of the month.
<SNAP>

Well Janez, I never got an answer to that question from any of the posters in this thread, and except for Adam Klubowski who incidentally was the only one that actually kept an open mind and give an unbiased opinion, all the other posters kept throwing arguments at me which had nothing to do with GNU applications at all.
The one who turned it into a MagiC-MiNT item was you... reread the thread, four little words like "I'm not a MiNT-fan" which incidentally were pulled out of context were enough to get you going. The two paragraphs in which I praise MiNT, went unnoticed ofcourse.

>U realy dont get it really? Again, how hard is to doubleckick DOSFSCK.TTP
>and type "-a D:" into TTP comand dialog box??? I dont know if u wana make
>us look stupid or yourself.. U keep talking bout unfriendly and complicated
>app, etc and all it need is 4 characters! What is easier if u use GUI? U
>still need to click on automatic repair (-a) option and a drive u want to

>check (X:). U really need to do absolutely the same i both cases...

No, I'm afraid you don't get it....
I only used DOSFSCK.TTP as an example, just like I used MKSOFS to underline one of my points. As far as operating DOSFSCK goes, you're right ofcourse, it's a piece of cake to operate, but you know very well that this is not the case with all the ported apps.

>>now aren't important. Far more important is that this application from now
>>on will be used by a lot of more users then ever before...
>> ...and if I'm not mistaken that's the ultimate goal of GNU software?
>
>Well now u contradict yourself.. U actualy meant to use an application
>of Unix origin? Ported and thus Atari platform killer?

I don't contradict myself at all. Did I write anywhere that I intend to use it? I said it was important because now it *possibly* will be used by far more people.

>That app still dont recognize the protocols u like so much

True, so what shall we do about this? Kill Gregory in an extremely painfull and gruesome manner? Shall we nail him against the wall because he tried to proof a point and did something about it?
OK.... using ASH Scripter as a means to "convert" apps like DOSFSCK.TTP is not a good idea since most of the MagiC users never bought ASH Scripter. So only a very small percentage of the MagiC users will actually be able to use his script...
Happy now? You can now write another post asking how I dare to criticize someone who actually did something.... :-(

>and u clearly stated what u think about those apps. Wont that thread your
>Atari feeling?

Not at all, I don't intend to use DOSFSCK at all, it's much to limited for my needs to begin with. I'm using a beta version of a new application that will be released somewhere this year, and unlike DOSFSCK it comes with features most of us expect a program like this to have, it's written by a talented *ATARI* programmer, comes with an incredible looking user interface and doesn't neglect long established Atari standards at all.
My Atari feelings are still intact ;-)

>>True, now that dosfsck has been fixed, I'll have to zoom in on another
>>target, just watch this space <grin>
>
>Well why dont u zoom into GEM scripter then? And as backup activity to
>DDP offer .SIC files for some of nonexisted and wanted applicatons? This
>is not a teasing, its proper proposal.

Me and the other two DDP members have a "to do" list glaring at us which is at least a mile long, Derryck and Peter are old and wise enough to speak for themselves, but there's absolutely no way I intend to even consider your proposal, I don't have time for "backup activities", and I'm not about to

waste time on something only a small minority of the users *might* find
usefull.
Let's talk again in 14 years from now, when I retire....

Cheers from Belgium
Dennis

You put papillon twice. You like this one or tried to make the list as
long as possible, huh?
As far as GNU software being better than these applications, not too hard.
In my opinion:

Gimp > papillon
Nedit > Luna
tcl/tk > ASH scripter

To name a few.

If it was not for MiNT, doom, SDL lib games, (Thanks Patrice!), would just
not be possible. gcc + libs made that possible.

Hi Lonny,

>I can tell you that on my MiNT system(s) wdialog causes CAB and QED to
>crash after several startup/exit cycles, at which point nothing that
>tries to use wdialog will run, one is forced to reboot.

You told me this already...
If a system extension makes ones system unstable then the most sensible
thing to do is to remove it. I *know* that there's a problem with Wdialog
and MiNT, too many people have reported it to ignore it.

>One can defend wdialog to the end of the earth, it's simply a bad design
>and one should not have to take steps backwards. That is not bashing
>either, it's simply the facts.

Hohoho.... hold your horses!!
You're the one having to take steps backwards, the MagiC and/or SingleTOS
users keep on walking straight forward. And that's also a fact... a fact
which you obviously like to ignore, but nevertheless.

>Those who have it working under mint problem free should step forward and
>explain just how they go about it.

Simple, one puts it in the auto folder and forget all about it... that's
how it's installed here; MiNT 1.15, N.AES 2.0 etc on a TT

>Simple test, remove wdialog and QED and CAB can be started/exited many
>times without crashing.

So what? all you've got left then are a QED and CAB with crippled features,
care to explain how printing works and how prints look like with these apps
when Wdialog is missing?

Cheers from Belgium

>again, whose standards are the ones to follow? My vote would be the ones that
>are compatible with the most TOS (not Magic-only or Mint-only) software.

Andreas Kromke went to great lenghts in ensuring compatibility with MiNT, one only has to glimpse through the developers manual of MagiC 5 and 6 to realise this. Unfortunately the same can't be said of the other party involved, but let's not forget that almost 99% of the apps run on both OS's.

There are standards set in stone on this platform, the problem however is getting programmers to implement them. I've heard excuses here last week ranging from too difficult all the way up to too boring...

Cheers from Belgium

Hi Frederic

>Hey, guess what?
>singletos, magic, geneva don't have memory protection. So your point is
>not really valid. Any clean application will work on any OS as long as
>the OS hosts the necessary calls, and that they are compatible across the
>OSes. That's pretty simple.

So what?
I'm not really all that interested to know why and what makes an application runs, all I care about is that it does what its expected to do. WDialog does just that, and to remind you once again: the programmers never stated, said or hinted that WDialog would run under MiNT. Why can't MiNT users accept that fact and let it rest?

>Singletos, geneva are missing a LOT of calls that magic/mint have.
>So there is a difference right there. Then you can separate further, mint
>and magic although really close now with latest versions are still
>incompatible, some calls like pexec() are not the same. What is a coder
>supposed to do? which one is correct? What documentation should the coder
>follow? There are many inconsistancies like that.

Are you trying to tell me now that freeMiNT is missing some necessary calls which are present in MagiC, TOS and Geneva? I'm no programmer but AFAIK WDialog is an extension ment to enhance the features of the AES, from where I'm sitting I think something isn't quite right in N.AES and/or the other freeMinT AES's. Wdialog isn't the only program that conflicts with these AES's, you may call them a dirty hack as much as you like, the fact remains that apps which have a problem under freeMinT/AES usally run just fine on the three other OS's.

Cheers from Belgium

Hi,

I don't have objections to the light stuff, anyway, so if you'd like to send me some, go right ahead; any
other subjects available would be nice, though. I'll settle for some of the images you mention in the mean
time. (I'm not enough of an artist to create acceptable images myself, and it's just to mess around with
the program)

Please use gvan dot bavel at hcc dot nl if you can keep it under one meg. If you use admin at vanbavelonline dot com (yes, a vanity domain) you can go up to about 10 megs.

Thanks in advance.

Regards,
Wef

Do you have the Studio Module for Cubase Audio Falcon? If so, I have a manual that includes the studio module, style trax, etc. It doesn't include the main manual for CAF, just the supplements above.

Email me if you're interested... $5 for shipping and it's yours.

>I wondered if you are still interested/you still have the time to
>maintain "native" fVDI drivers??? Please note I have nothing against

I do not really consider them as being maintained at this point in time.
I try to keep at least the monochrome and the 16 bit driver up to date
regarding interface and convention changes, though, and for the next
real release (which shouldn't be too far off) I might do the same for
the 16 colour driver. It is not likely that I'll be doing any new
development on the bitplane drivers in the foreseeable future, but
fixes for reported bugs might be done.

>you not maintaining them but I would just like to know:
> - if old "native" drivers are compatible with recent fVDI (beta)
>releases;

That should be easy enough to test. ;-)
I do believe the latest binary versions of those drivers should
still work. The sources probably no longer compile as they are, however.

> - if you plan to do an "official" release (with up-to-date docs & all
>working drivers in a single archive) soon;

I do.
I have been planning that for quite some time, but now is definitely
closer than ever before. ;-)

> - if the API between main fVDI program and drivers could now be
>considered stable;

No. There will be substantial changes.
They will not require any changes worth mentioning in drivers that are
already using the C (stack based parameter passing) API and the standard
driver integration/initialization code, however. The assembly level API
(parameter passing in registers) will go away completely and parts of

the standard driver integration/initialization code will be moved into
the fVDI engine.

Nothing worth worrying about for a driver developer.

> - and if you could perhaps consider putting "native" drivers source
>code under some CVS tree somewhere (AtariForge comes to mind)...

There has been an fVDI CVS server for some time now, but since I was
not able to provide read only access, it has only been available to a
few people.

Due to a move to a new apartment, my ADSL connection is currently down,
but once I get it back again I also expect to have a real, Linux based,
CVS server working. Then there will be public read access and write
access for those who need it.

>had the time), but I think the current "stalled" situation as regards
>"native" fVDI drivers could be improved a bit that way...

That would indeed be nice. It remains to see if it'll happen.

Hi Frederic,

>But in my case and my case only:
>I can choose any editor I want (qed, everest, pico, vi, emacs
>whatever)
>I can read my mail remotely (thanks to the non-gui interface).
>pine is available on all platform, that's what I use on all my comps.
>More importantly though: it supports IMAP. ASH emailer as far as I know
>just does not. That's a BIG seller to me, especially when I don't want to
>store email on my machine and when I have 1140 email or so.

True, that's a big seller.
If someone needs IMAP, then he wont find it on any of of the Atari mailers.

>Also, I don't know how well emailer would handle 2000 email.

Without one single glitch, at this moment there are roughly 20.000 postings
and 4.000 mails stored in emailer, the file is 280MB large. Emailer handles
these posts just perfectly and without any loss of speed. There used to be
plans to make the database file compatible with the ASH Phoenix database but
alas it never happened :-(

> Did I mention it is free, comes with src and is constantly updated?

Yes, I think you did :-)
But as a non-programmer I don't really need the source of an app, and as for
being free or commercial... I bought Emailer in 1997 for DM 60, I consider
that DM 60 to be very well spend. It's an application that I use daily, and
over a period of five years it never let me down once. When I encountered
problems, these were ISP related... as for being updated, the last update of
emailer is only two months old.
There aren't may people here who can say the same thing about their mailer &
newsreader. One only has to weed through the numerous postings that have
appeared here from people who lost mail and postings over the years with
their preferred *free* mailer or newsreader....

>Oh the bad thing is that I can't have background images in it like emailer
>has. I guess I will switch to emailer because I like nice pictures and
>screw my IMAP mailbox, I'll just switch to a pop3 account.

Nice one Frederic ;-)
Background images are an option, not a necessity. You should consider Amail,
this one can even play samples!! oh and it's free...

Cheers from Belgium
Dennis

>I seriously doubt. Making a c-icon toolbar following atari standards is
>not that hard, but then, if I remember it looks all weird in magic (with
>way too big border 3d effect on the icons)

Your memory plays tricks on you. Papyrus looks under MagiC just like the
programmer intented it to look, don't take my word for it, start up a RSC-
editor and take a look for yourself, next start up Papyrus under freeMint
and N.AES to see what that combination makes of it...

>calamus was a dirty hack (old versions) I don't know about latest though.
>But I understand they fixed a lot of things.

Yes, they fixed it, but you should also ask at what cost...
Calamus is dead slow on a 68030 now and garbles up memory, I prefer the
"dirty hack" (Calamus 94,95,96) which is reasonably quick and runs just
fine under both SingleTOS and MagiC.

Cheers from Belgium

Absolutely.

Peter and myself have spent the last 12 months translating and tidying the
Calamus 2000/2002 manual and the text which is compiled into the binary for
the actual program. Getting involved in learning how to program Scripter's at
the bottom of the list, which is not to take anything away from what can be a
very easy to use application.

>Let's talk again in 14 years from now, when I retire....

I'm waiting that day too, but I'm hoping that it will be in 4 years...

At least it is clear now. As far as bugs are concerned: should the
fact that it seems not possible to switch resolutions (or at least
color depths) under the desktop without crashes be considered as a
bug? (This was done with a CT2-ed Falcon though so it perhaps works on
other configurations...)

No promises given here... :-) But it could motivate some other people
(programmers that feel uneasy for using a cracked version of NVDI for
example...) to jump in!

Thanks for the neat answer anyway!

Could you tell me exactly which dialog boxes you are having problems with
and how to get to them? I've heard people talk about them, but I've never
found what they're talking about.

Hi,

I just wondered if it is possible to add some RAM to a TT without
needing it's hard-to-find RAM expansion boards ?
That's for a friend whose TT's only 2 MB (he used to have 4 MB TT-RAM
too, but this died for an unknown reason, so he trashed it :-( ).

Thanks in advance,

J.-Luc

Has anyone using a Falcon/CT2b ever used the Turbo/TOS 4.x mode
succesfully ?

I can use my Falcon with the CT2b switched off or in Turbo mode with TOS
7.x. But I when I select TOS 4.x from the CT2b bootmenu, my Falcon crashes
almost immediately. Is this mode completely useless, or am I doing
something wrong ?

I get that now and then. There are some programs when run together
under Magic that would cause this. Also, you might change the order of
your auto folder. That is what did it for me concerning Papyrus.

Hello,

I get the same thing when I save either Tiff or TGA image using Smurf.
Loading that into ImageCopy results is a wierd looking picure. However
if I use PhotoTip or Photoline, things are fine. I heard tell that the
problem had to do with Smurf, but that is only a rumor and not fact.
Where did the image you are loading into IC come from? Try using a
different program to make the image.

T think I tried that mode too when I got the CT2b but since IIRC it
is the same as 7.x but without fastram access it seemed to make no
sense to use it afterwards.

How about the "Print" dialog for a start. The "Special Opts" button bar's shortcut underline is a good two character spaces shy of the start of the text, let alone under the character that is supposed to represent the actual shortcut itself. That means that the shortcut for this command is the Space bar!!!!

There's various dialog boxes containing what seems to be an entire novel as button bar text, which makes the bars, and hence the actual dialog box, so wide as to almost go off the screen. Why the actual dialog box text wasn't amended to include some of the button bar text beats me!

Cheers

Yes, but to be honest I've never had to use it (I did have a problem with
copying files to floppy with TOS 7, but that's been sorted since).

It should boot up with the familiar Fuji logo along with the memory test and
boot delay if so configured.

Have you used the Centek NVRAM resetting tool and reset all the parameters?
Could be that it's become corrupted over time.

Cheers

3716. STE Joystick ports

Newsgroup: comp.sys.atari.st
Date: 2002-04-25 15:15:00 UTC
From: Mickael Pointier <mpointie@eden-studios.fr>
Message-ID: <aa95qs$eo9$1@reader1.imaginet.fr>
Source record: 35415

Hi.

My question is simple: Since the STE has two
additional joystick ports with anolog input,
I wonder if it's possible to do any kind of
signal sampling on it ?

Is it possible to sample audio data, and if
yes, at which frequency/range ?

Dbug

>and other fonts. So I'm looking forward Johan is on-line again ;)

Actually, I've been online again for about an hour now. :-)
For unknown reasons, my ADSL provider got the connection moved about
a week _sooner_ than they said they would...

Of course, this unexpected turn of events means that I have not had
time to set up that Linux based CVS server. The old one (to which only
a couple of people have access) is up again, though, as is my ftp site.
My new IP address is 217.215.149.49 (sorry, still no decent domain name).

>
> Is it possible to sample audio data, and if
> yes, at which frequency/range ?

This STE aditional joystick ports look like 15-pin pc analog joystick ports,
but they are not. Signals at this ports are standard joystick signal (like
joystick you can hook up in STFM, AMIGA or 8bit machines). There are some
aditional signals for paddles, etc.

COncluding: sampling is impossible (well, nothing is imposible), but using
an adapter you can hook there two aditiona joysticks, paddles or jagpads.

I'm having problems with the floppy sometimes. What did you do to solve
your problems ?

> It should boot up with the familiar Fuji logo along with the memory test and
> boot delay if so configured.
Yes, the Fuji logo appears just fine. But after some (HDDRIVER ?) messages
my system hangs with a long row of bombs. Maybe I have to change some
settings with HDDRIVER, ot try a different HDDRIVER version. (I now use
HDDRIVER 7.71. I also have 7.8 (an official disk with a Serien-Nr herr
Seimet :-)) but 7.71 worked better with my CT2b. I also tried an 8.0
demo, which also seems to work. Maybe I'll order an update, and try the
fully working version.

Hi Paul,
Also, since doing that, every other stereo (8 channel) audio recording
is trash! #1 = ok, 2 = bad, 3 = ok, 4 = bad, etc.! Not sure why yet!
Another fluke is a disruption in data sent to the printer if the
Spooler.acc (from the Cubase package) is loaded. No spooler = printer ok!
Lotta' fun eh? :)

> ranging from too difficult all the way up to too boring...

It works both ways. Example: SLB's. They were born in MagiC, and they are
avialible in FreeMiNT 1.15.5 (IIRC). THere are some proposals coming from
Konrad Kokoszkiewicz to improve them a bit (there are some unused (reserverd
for future use) things that he proposes to use), but I do not know results.

SLB's are good, but they are not real shared libraries, they do not have
the full funcionality that shared libraries are expected to have, please
dont ask me what is missing, I'm not an expert in this area.
That is why, there are plans of implementing an ELF execuitable model in
FreeMiNT along with ELF-style shared libraries.

The most confusing thing, that there are few standarts of shared
libraries on our platform. THerefor an unification would be handy. ELF style
executables and shared libraries are logical step foward, but that will mean
loosing some compability (they will not work in SingleTOS, and Magic (or
work it thy will be implemented)).

If you do not know ELF standard is standard of rxecutables used in lots of
operating systems (mostly unices), Linux is one example.

> AES's, you may call them a dirty hack as much as you like, the fact remains
> that apps which have a problem under freeMinT/AES usally run just fine on
> the three other OS's.

he problem is that that aplicantion, mor or less abues exiasting standarts,
or brake them. Yes, it works under SingleTOS, but in other (compatibile
systems) it may not work.

Imagine: You are developer of OS that have to be compatibile with some older
OS. You know that there are some programs that brake/abuse rules of those
old OS. What can you do?

1. You can bash that programs
2. You can modify your OS to allow this abusers/breakers to run.

The second approach gives you lots of additional work, and makes your OS
more complicated. It is harder to write that kind of OS, it is most likely
to be buggy, and crashy.

The first approach cuts some programs, but you are 100% sure that programs
that follow rules will work correctly. You have less work and much simpler
OS to develop.

MagiC is an example of first approach. It is a COMMERCIAL system, that
developers care to run as much software as possible.

FreeMiNT is an example of secound approach. It is developend by group of
volounteers, that use their spare time to develop it. Thats why they
selected secound approach. THe only program that they specially care for is
AES (yes, it is not 100% clean too).

FreeMiNT has all the functions that SingleTOS has (I'm speaking about system
calls), and tgey behave the same way (or better if SingleTOS functions had
bugs) and give the same results that SingleTOS gives. THat means that any
application written for SingeTOS, that follows the rules will work under

FreeMiNT to.

You want another examples of secound approach? M$ Windows is one of it.

Yes, my personal opinion is that FreeMiNT is better then MagiC. One proof: tzhe kernel has been updated yesterday, hitting some bugs. <teasing>I could ask about MagiC. But I will not ;) </teasing>

Hi Jean-Luc,

CJL>That's for a friend whose TT's only 2 MB (he used to have 4 MB TT-RAM
CJL>too, but this died for an unknown reason, so he trashed it :-( ).
AFAIR the TT has 2 meg ST-RAM onboard, and that's all so far.

You may add a ST ram extension card with 2 or more megs, max. 8. Mine
has therefore 10 meg ST ram.

And TT ram may be added (with a fast ram card of course) up to 128
megs. But some rams don't 'play together'. I put a 32 meg ram onto my
aixTT and had to remove the original 16 meg, so 48 is impossible to
me. :-(

Und TTschï¿½

A friend has a Mega STe and the batteries in it were corroded. We
replaced the batteries and but the system no longer auto boots the HD.

The system boots fine with a floppy disk but only A and B icons show up.
Installing new icons don't work.

What is the procedure for making a hard drive bootable from scratch?

Thanks...

New Lynx Daemon's Gate $49.95

Tons of new items ready or soon to be ready to ship.
Ready now!! Lynx Daemon's Gate Test Cartridge. This appears to be a complete working Deamon's Gate for the Lynx. It is a Role Playing Game by Imagitec, the same people who did Viking's Child. No instructions yet. I will post instructions as you the role players E-mail them to me. Now shipping at $49.95 S&H. Call today. Coming soon. Demolition Man Video sequences for the Jaguar on Un-encrypted CDROM. My first batch of 30 had a bug from the duplicator and did not work. Hope to be shipping in a week for the initial price of $30. This is 20 minute of video sequences made for the game but do not include any of the actual game play. Also it requires one of our new CD Bypass cart, or Jagfree, or Protector SE, or Battlesphere Gold, or CD R, or a DEV System to run this un-encrypted CD ROM. Shipping next week our new CD Bypass cart at $39.95 allows you to run Un-encrypted programs on your Jaguar CD-ROM System. Also we plan to start shipping Charles Barkley Shut Up & Jam for the Jaguar in May. We have 5 more CD-ROMs in the works that will be IBM compatible with developer stuff from Atari Engineering. Hope to sell these at $14.95. First one is RAW digital and sounds souces for Demolition Man and another is Jaguar Artwork files in EPS, TIF & Gif format and another Leonard Tramiels TT hard drive backup, and anotherST & TT Atari Archives and another??? Watch for details.

Hi laurent,

>Sorry i ddon't how the sampling rate, but i know
>it's work.

I belive it is as fast as you can access the port, so you'd have
to do some maths on your loop in assembly code, and work out how
many cycles it takes for consecutive acceses. So, say 44100KHz
(CD sample frequency) needs about 22 us I think.

Message-ID: <aaa6f2$9hs$1@mohawk.hwcn.org>
Source record: 35437

I recently found on an abandonware site, a copy of Chaos Strikes Back for the Pee Cee that works under Windows 95. It seems that some fan disassembled that game for the ST and ported it to the PC. I think this is great news for fans of the game.

3738. CCAG 2002

Newsgroup: comp.sys.atari.st
Date: 2002-04-26 01:18:48 UTC

Message-ID: <YV1y8.318$t3.159441@news1.news.adelphia.net>
Source record: 35438

The Classic Computer And Gaming(CCAG) Show 2002 is on!

"We, the CCAG organizers, regret that it took so long to officially announce the CCAG 2002 Show. However, we are also very glad that the CCAG 2001 Show did NOT take place after September 11th, 2001. Had CCAG 2001 taken place after 9-11, we would have had to cancel. Because we had used a National Guard Armory for the previous two CCAG's, we were not able to rent the Armory again after the events of 9-11. We have been able to locate and secure a facility for CCAG 2002! We again apologize for the delay, as we were only able to know with certainty, in the past several days. See you all at the CCAG 2002!!!"

CCAG 2002 Staff

The Classic Computer And Gaming Show 2002 will be held on May 25th, 2002 from 8AM till 2 PM. Vendor setup is on the 24th from 5:30PM till 9PM, and from 6:30AM till 8AM on the 25th. Show location is at the St. John Lutheran Church, 11333 Granger Road, Garfield Hts. Ohio, 44125.

Here is our own site for more information and current status of vendors and attendees.

www.ccagshow.com

Table rental is $5 this year, and admission is only $2. The admission fee will also allow you to be eligeble for a drawing at 1PM, the 25th, for an Arcade machine! (You will need a way to take the machine home with you!)

The web site, www.ccagshow.com, has site info, table layouts, map info, etc.

We hope to see you there at the CCAG 2002!

CCAG will have a limited number of a CCAG-exclusive release for collectors!!!

This is very unlikely. The TT puts out ECL digital signals (-5 to 0
V). A color monitor is likely RGB analog (0.7 or 1.0 Vpp).

Assuming the hard drive is connected properly...

Run HD booting software off of a floppy. One of the options on the
software is guaranteed to be autoboot. AHDI is the software that came
with the ST (and is freely available).

It is a great game. I found Dungeon Master II for the PC on a bargin
shelf for only $10. Could not believe it, but it is made by FTL.

Wrong. Theses games ports include two Analog input X and Y axis. I did
some time ago a small analog paddle just for test and it work very
fine on my Falcon; Sorry i ddon't how the sampling rate, but i know
it's work.

have a look to my page, sorry it's in French, but you can look
the small schematic and download a nice GEM program, which draw a small
point that you can drive from a paddle or finaly two variables
resistors.

I'm sure he meant a 19" Mac mono monitor. I had one and it was 19", and same resolution as the TT. Didn't have a TT at the time so to the dump it went.

Joshua.

What HDDriver messages do you get, should be a sign-on, a list of devices found
(assuming they've been set up with the utility program), how much memory has
been allocated and a list of the resulting partitions.

>settings with HDDRIVER, ot try a different HDDRIVER version. (I now use
>HDDRIVER 7.71. I also have 7.8 (an official disk with a Serien-Nr herr
>Seimet :-)) but 7.71 worked better with my CT2b. I also tried an 8.0
>demo, which also seems to work. Maybe I'll order an update, and try the

Some versions of HDDriver work better with the CT2 than others, this has been
covered before. If the demo version works then that's the one to buy it seems!
:-)

If you've got the latest flash file for the CT2 then there is a hard disk
driver built in.

Cheers

Hi Steve,

Forwarding it to sinplop is a great idea. But not for the reasons you'd expect. It didn't transpire in either of these 2 groups but Sinplop is an admitted Dell user. Explains why he's never been near *any* mac NG's in the near decade long tirade of his against ST and amiga users. When I've confronted him about it he's been doing some serious backpedalling about what computer he really owns. Probably explains why he's made himself scarce for a couple weeks in hopes nobody else would notice.

|
| This STE aditional joystick ports look like 15-pin pc analog joystick
ports,
| but they are not. Signals at this ports are standard joystick signal (like
| joystick you can hook up in STFM, AMIGA or 8bit machines). There are some
| aditional signals for paddles, etc.

Atari seem to think that there are Analogue to Digital converters present at
these ports, at least there are on mine as vie used them for analogue
monitoring in the past.

Dungeon Master II is certainly "more" Dungeon Master, however, it is too short, and in my opinion has a couple of annoying features. The "sentinals" are just plain maddening, and the theives are too aggressive in my opinion.

If you don't have an Amiga or an ST set up, Chaos Strikes Back wasnt available to you easily. I understand that some people have gotten it going under emulation, but that is a pain.

There is another Dungeon Master that I know of. I have a copy of it, for the Saturn. However, it was only released in Japan. It has Japanese in the game for the puzzles, so, that will of course be a bit of a challenge.! The game is called "Dungeon Master Nexus" and it is a unique Dungeon Master episode that was only released on the Saturn to the best of my knowledge.

now that is interesting. So The iDiot Forever Known As Sinclap was coasting on fumes (or, more appropriately, Mac buzzwords) in all the time he was making a fool of himself. And he WASN'T licking Steve Jobs' boots, he was licking Michael Dell's all this time! (Not too surprising, though, seeing as Michael Dell is a Steve Jobs wannabe who's done everything to try to copy Steve while all the time badmouthing Steve and Apple, and claiming he was first in technological breakthroughs that Apple actually did first)

I sorta suspected that TiFKAS was posing when he made that outlandish claim that he was at a Macworld Expo and saw some killer MIDI applications from Adobe :). And it was confirmed when I mentioned that I was going to Macworld NY, and suddenly TiFKAS couldn't make it there - not to mention that in the two times I've gone to Macworld Expo, not one Apple Power Rep from the place he supposedly worked there had heard of him (oh, and that claim he made that he couldn't reveal who employed him because of "non-disclosure agreements". Completely bogus)

If he had been a mac power rep he'd have been fired quickly for violating "non deception" agreements. No real apple dealer is gonna block any employee from stating where they work. A few months back I went through his drivel via groups.google.com (a site tifkas claims doesnt work even when he posts from it). I discovered a few things. One of which is he's consisntently lied about where he lives (and works) claiming to be from minnesota, nebraska and a few others, the last claim he made was that he was in china which he insisted was "300 miles south of iowa". Also from his .sig in previous messages and the times he's been questioned on it he's claimed to have a completely different model of Mac every time. What gets me is he's been posting the same dozen messages over and over for the past decade. I'd always wondered how tifkas manages to get up again and come back for more sporking after being proven a liar so many times. Most other trolls are either sporked into oblivion or simply give up in a much shorter time.

His next slip up will likely be a claim that his "iMac" (with the dell logo on the front) runs OS2 (not OSX).

Bummer..!

I just checked underdogs.org and the abandonware site seems to be
gone..!

I've got several of their games bookmarked to go back and download
when I've got several hours to get them, and none of the links work
any more.

Now it looks like a Yahoo gateway "wannabe".

I'll have to search to see if anywhere else has it.

Hello,

A few days ago someone uploaded an archive called *popcorn.zip* (6.478
bytes) on the Belgian Atari ftp-server. No docs are supplied.
Does someone know what popcorn.prg exactly do?

Also the same guy uploaded "orictool.lzh" (oriclink.c, txt2bas.c,
txt2bas.ttp)
What is it good for?

Short?? It does not matter how short the game is. It is Dungeon Master
and that is all that counts. As far as the annoying features you
pointed out, that is ok with me, but I can see your point.

Oric, oriclink? Sounds like some sort of program to upload bsic
to the old 8 bit Oric computer, made by BBC/Acorn I think, and
possibly the same people who made the Electron. I assume you
can write in a text editor your basic code, and send it to the
Oric.

You can also hook up a lightpen. I built one a few weeks after I
bought my brand new 520STE in 1990, and wrote some code in GFA basic.
Worked OK except the resolution isnt that good.

Yes, I agree. However, DM II was not well received by the critics, and
didnt sell as well as it could have. I think the graphical improvements to
DM II were great.

This DM Nexus looks really good although I havent fired it up yet.
Obviously, they have another DM game made, they just need to port it to
PC or another mainstream video game.

Unfortunately FTL could never get anything done- they had a lot of great ideas, but could never seem to actually finish them..

Remember how long it took to get the original Dungeon Master out?

The demo was shown something like 1 1/2 to 2 years before the final game hit the market, and CSB (which was NOT a "sequel", only an "expansion" of DM) took almost as long.

They had some great ideas for a "SciFi" or "Space" oriented game based on the same 1st person graphics engine, as well as more entries in the DM genre.

I worked with them for a while on doing a "Prequel" to Dungeon Master to help teach new players how to play (simple puzzles, techniques like the "2-step", that kind of thing), but the idea never did go anywhere.

There was a version of Dungeon Master released in Japan for the "FM Townes" machine, as well as the Super Nintendo conversion, and of course the IBM project. They seemed to get lost in the rush to convert the existing games to other platforms, rather than developing NEW games.

Unfortunately, by the time they finally got the IBM conversion of Dungeon Master finished, other games in the same genre (like "Eye of the Beholder") had already stolen the DM thunder, and Dungeon Master was relegated to "also ran" status, at the bottom of the $5 game bin.

1) As TOS is still a licensed program, adn as each version is seperatley
licensed you
should only use ROMS for which you have a license, i.e. an ST that contains
a copy
of those ROMS.

2) As they are non-relocatable code and will only run from the ROM address
space
then what you actually need is a PROM programmer and the necessary hardware.

Having said that there was some extsive discussion of the recently
on here or the comp.sys.atari.st.tech I forget which. Check out the archives

I'm sure you can fit an ATX PSU from a MicroATX system into the MKX case as they are very small. You could possibly fit the guts of a regular ATX PSU there as well.

Joshua.

Apparently, the lady whom I mentioned thought so. Didn't look to me like
a good starting point for an agreement (and still does not).

Hello,

I'm never fed up of listening the great songs of Iso of Sentry,

I wonder if I could use some of his songs into a game and if he released MIDI or MODs of them.

If you know how to reach him, and Frak van Espen (xms.ttp player) I would be thanksfull.

Regards

Hi

After a year or so of problems, i'm slowly feeling human again and hope
to be more alive back in the Atari scene.

I'm still nowhere near 100% yet, but am feeling better.

I must apologise to anyone who has sent me email, i lost all my email
lists not once but twice:(((

I have still got tons of Atari stuff for sale, and am still collecting
items:)

If you are after anything specific, let me know and i'll see if i
already have it.

I can also take payment by NoChex.

I'll be working on the web sites a.s.a.p:)

It's going to take a while before i get things back to normal.

From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1020023134-274995AEicMi@adel6.freeserve.co.uk>
Source record: 35487

Hi All

Just bought an Adtron Accent SPC SCSI Card Reader for
my Falcon CT2B with the intention of purchasing a
digital camera sometime in the future!

The device is small and therefore doesn't have a
through-port at the back, all there is a SCSI II
connector and an ID selector which has 0-7 terminated
and 0-7 unterminated.

This is obviously going to be the last device in the
chain with no throughport! The physical chain is the
following:
Falcon -> CDRW -> Epson GT9500 -> PC Card Reader
IDs 7 1 2 6 Terminated

Imagine my surprise when I run HDRUTIL (v8.04) and do
a "Device Check", this reoprts the following:
01.00 Yamaha CDRW
02.00 Epson GT-9500
05.00 Adtron Accent SPC
05.01 Adtron Accent SPC
07.00 ATARI FALCON

Also on the Magic/Jinnee desktop:
P=Card Reader
Q=CDRW
And yet it should be that the CDRW comes first!?

Does the Falcon scan IDs backwards (ie 7 to 0)?
I have rotated the ID selector on the back of the Card
Reader and done a "Bus Rescan" but it doesn't seem to
change the ID from 5 (+ 01 LUN)! Is the unit faulty
or is there some other switch that would work?

The drive works like a dream (with a Compact Flash
adaptor & 16Mb Card) - just like an ordinary disk,
although Jinnee reports only 12Mb on it.

Any help appreciated!

Neil

I have such readers on my Hades and TT. Very cool.
My units are Microtech however.

> The device is small and therefore doesn't have a
> through-port at the back, all there is a SCSI II
> connector and an ID selector which has 0-7 terminated

The one on my TT is setup like this, cannot be chained so
it's last in the chain.

> This is obviously going to be the last device in the
> chain with no throughport! The physical chain is the
> following:
> Falcon -> CDRW -> Epson GT9500 -> PC Card Reader

Very similar to my TT030 setup.

> Imagine my surprise when I run HDRUTIL (v8.04) and do
> a "Device Check", this reoprts the following:
> 01.00 Yamaha CDRW
> 02.00 Epson GT-9500
> 05.00 Adtron Accent SPC
> 05.01 Adtron Accent SPC
> 07.00 ATARI FALCON

I'm not sure why you get this list unless it's a dual card reader?
If not that seems strange. I have a dual card reader that if assigned ID #5
will then show up as ID #5 and #6.

> Also on the Magic/Jinnee desktop:
> P=Card Reader
> Q=CDRW
> And yet it should be that the CDRW comes first!?

Well if you are using ExtenDos, then the extendos config determines
the drive letter. I don't think the ID matters. On my TT030 the
CD-ROM is also first in the chain, yet I have assigned it as "P".
I'm not familiar with Jinnee, perhaps it has saved the drive arrangements

in a config and you need to re-mount them?

> Does the Falcon scan IDs backwards (ie 7 to 0)?

I can't answer that, I have no Falcon.

> The drive works like a dream (with a Compact Flash
> adaptor & 16Mb Card) - just like an ordinary disk,
> although Jinnee reports only 12Mb on it.

Formatted capacity might vary, versus raw capacity perhaps?

From: Ken Kosut <kjcat@shell.voyager.net>
Message-ID: <3cccc810$0$3342$1dc6e903@news.corecomm.net>
Source record: 35493

Hello,

I am trying to read some .HYP and .REF files that came with
my CAB 2.7 package.

I have a folder called:
BUBBLE
It contains:
BUBBLE.APP
BUBBLE.HYP
BUBBLE.REF
BUBBLEGEM.CPX

Under MagiC 6.02 I installed application (BUBBLE.APP)
associated files:
*.HYP
*.REF

I copied BUBBLEGEM.CPX to CPX folder, rebooted.

Why can't I see the .HYP or .REF file?

Do I have to use ST-GUIDE in order to view this type of file?

Thank you in advance.

ken

*.HYP and *.REF are !NOT! BUBBLE.APP associated files. Please de-install.
You can install ST-GUIDE.APP for *.HYP files. Installing for *.REF files
is not needed.

>
> I copied BUBBLEGEM.CPX to CPX folder, rebooted.

Bubblegem is a totally different kind of help system. If bubble.app is
started, other programs can make use of it to show little
helptext-balloons when right-clicking on certain icons. I never used the
CPX, is it to configure some settings maybe ?

A *.HYP file is a complete helptext with mouse-clickable hyperlinks, that
can be read with ST-GUIDE. If properly installed, this program is called
by other programs when (for example) hitting the HELP key or selecting a
"HELP" button in a dialog. But you can also start ST-GUIDE as a seperate
program or accesory to read HYPertexts. Don't forget to read and edit the
st-guide.inf file for a perfectly working help system.

Possible. Maybe HDDRIVER, in general an excellent program, isn't the
problem. The next thing to look at should be superboot, since my system
crashes before my bootselector screen shows up. The auto's and acc's
haven't started yet at that point, have they ? I'll keep experimenting

I must admit I haven't really tried it much. But does Cecile support my
MiNT (ext2) partitions, does it have the SCSI support that is needed by
for example my SPiN CD driver?
Besides, the one or two times I tried to boot with it my harddisk wasn't
found. Maybe I should read the docs again, to find the right settings. But
why should I if I will keep using HDDRIVER.

But thanks for your help.

IMHO it's good to stay with HDDRIVER. When I got my CT2B I first used
Cecile (since Hushi which I used before didn't work in turbo mode)
but because of problems I changed to HDDRIVER (7.81 I think) which
works reliable on my machine.

Hi Adam,

>It works both ways. Example: SLB's. They were born in MagiC, and they are
>avialible in FreeMiNT 1.15.5 (IIRC). THere are some proposals coming from
>Konrad Kokoszkiewicz to improve them a bit (there are some unused (reserverd
>for future use) things that he proposes to use), but I do not know results.

What about threads? These were born in MagiC also, these threads are Solaris compatible, it's not like Andreas Kromke reinvented the wheel and implemented a complete non-standard protocol. A bit later on, the freeMiNT developers also implemented threads, but decided to make them Posix compatible. There will probably be a couple of good reasons why they didn't follow the Solaris route but from a users viewpoint it only ment that the two OS's grew further apart. If a programmer wants his program to run using the threads, then it will either run under MagiC or MiNT, but not on both, in practice this means that hardly any programs are written which use threads.

BTW: Seriously: Is the MagiC PDLG.SLB (Wdialog replacement) also a "dirty hack"? I suppose that someone has tried using the SLB instead of Wdialog under FreeMiNT?

>If you do not know ELF standard is standard of rxecutables used in lots of
>operating systems (mostly unices), Linux is one example.

I didn't know...
Last week in a reply to me calling linux & unix a small minority making a lot of waves you told me that there are 5 million unix & linux users out there. I certainly wouldn't want to feed that lot, but compared to the 1 billion users of which six hundred million are on internet, these 5 million are a minority. Unless someone is really interested and follows everything that happens on those platforms, it's no big news for the majority. I find it hard enough to stay up to date about what's happening on this platform....

Cheers from Belgium
Dennis

Hi Frederic,

>As far as GNU software being better than these applications, not too hard.
>In my opinion:

This was not about GNU software being better, it's about Mark his statement that all free software is just as good or better then commercial programs. But since GNU software is free also it's only fair to include it in this comparisation. But...since most commercial software runs on the three major OS's, I expect stuff which is just as good or even better to be able to do the same, that's a reasonable assumption, right? So commercial software has just scored a point :-)

>Gimp > papillon

But that's like comparing apples with pears!!
Gimp should be put against Photoline not against Papillon, but then even against Papillon, Gimp looses points...
-Papillon can run on a standard 1Mb computer,
-Papillon can take scans via the GDPS protocol
-Papillon can handle IMG, IFF and GIF
-With Papillon one can handle/edit/construct animated GIF's
-Papillon is an OLGA client
etc...

Against Photoline which is a comparable program is also looses points...
-Photoline runs on a standard Atari 2Mb computer,
-can handle the Calamus CVG 1.0 and CVG 1.1 formats,
-the 3 GEM formats are no problem either.
-Realtime input from a scanner or graphic tablet
-Output via NVDI allows pixel fine tuning to paper, file, plotter or cutting plotter
-Can load and save GIF
etc...

There are no GNU apps matching these criteria, popular Atari graphic file formats which are a standard on this platform are not supported. Are there any GNU apps around which can convert and handle the 3 GEM formats and CVG? Is there a GNU package that allows a user to use his scanner on a Atari and transport the scans straight into Gimp? As powerfull as Gimp might be, on a Atari the average user will realise after a very short period that he's using "second best". Oh... and what is the *minimum usable* configuration required to run gimp? Papillon and Photoline both run reasonable well on a

humble 68000/8Mhz... they even fit on a floppy disk :-)

>Nedit > Luna

This is a joke right?
When was the last time you've layed eyes on Luna? Download the latest demo
to find out why there's nothing on this platform that can beat Luna.

>tcl/tk > ASH scripter

Oh boy... <deep sigh>
You've seen the very little that it takes to give DOSFSCK a GEM-front, can
the same be achieved with tcl/tk? Is it compatible with GEMScript? Can I use
the Jinnee plugins? etc...
Need I say more?

Cheers from Belgium

Hi Djordje,

>>oups, How can I forget:
>>MySQL >> phoenix database
>
>I assume from the context that there is an Atari (mint?) port
>of MySQL. Where can it be found?

It seems to be one of the best kept secrets ever...
Frederic has referred me twice to the MySQL pages now, Atari nor freeMiNT is mentioned there even one single time!! Which incidentally applies to Gimp also. Which makes me think that the maintainers of these sites have either no clue that these apps are ported for the Atari platform, or they they know but keep silent about it... why?

As far as Phoenix <> MySQL are concerned, MySQL is no competition at all for someone who for example wants to include some graphics and/or sound in his records, I'm not even going to mention the clumsy method used to genererate reports.

Cheers from Belgium

From: Adam Klobukowski <atari@gabo.pl>
Date: Thu, 25 Apr 2002 20:03:39 +0000 (UTC)

Hi Adam,

>Yes, my personal opinion is that FreeMiNT is better then MagiC. One proof:
>tzhe kernel has been updated yesterday, hitting some bugs. <teasing>I could
>ask about MagiC. But I will not ;) </teasing>

Have I ever said or hinted that this wasn't the case? One only has to look at the features-list of the OS to realise that freeMiNT is more advanced. But having more features, being more advanced and even being more stable is not a guarantee of being more succesfull. From a programmers viewpoint freeMiNT probably is the preferred OS, but from a users viewpoint it's a different story.

There are people driving a car not knowing anything about the engine or the inner workings and they and are not bothered one little bit about this, there are also computer users out there running programs not knowing anything about the OS and don't care about it either. For these people all that matters is that the apps run on their computer. What and how makes them run is the last of their concerns.
Personally I don't really care either, if I click on a program it starts and then I start doing whatever it was I ment to do. The OS is a "weird" program that is running somewhere in the background, and being confronted with it is the last thing I want, normally when one gets a OS related message, it means bad news... and before anyone freaks out after reading this: think about it, I just described how the majority of the computer users regard and use their computer, not just Atari users but users on all the platforms.

The results of a poll conducted by MagiC Online last year indicate that 50% of the Atari users were still working with a ST/Mega 4Mb, AHDI hard disk and monochrome monitor, 30% of the users has a Falcon of which nearly 70% of them invested in a memory expansion. The remaining 20% used a TT, Milan, Hades or software emulator. A poll conducted by the German ST-Computer magazine among their readers two years ago showed figures which are more or less comparable.
So... in practice this means that Magic and MiNT cannot be used the way it's intented to by 65% of the existing Atari users... the percentage of people who actually use a graphic card and/or ethernet card is only 20%. Less then 50% of the readers actually used their Atari for internet, etc....
In CSAST which is the largest Atari newsgroup there are rougly some hundred regular posters at its very best, let's assume that the number of readers outnumbers the posters by a factor 10...
These posters are mainly using a high-end Atari system and among them are a couple of programmers and people who port programs. A number of posters use these apps and are pleased that someone went to trouble of writing/converting

them... reading the "happy news" postings here about yet another ported GNU application gives the (false) impression that the Atari platform is alive and kicking, the thruth is that it's in a very bad state and the "happy news" show is yet another attempt of making waves...
The majority of the users can't use these programs, not because they haven't installed MiNT but simply because of hardware limitations. Someone who's still happily using a 68000/8Mhz computer after all these years is not going to upgrade now, and if he invests money in a new system it will be a Mac or PC, not an Atari clone or second hand 68030 machine...

So port GNU software, by all means do it, but keep in mind that this is only usefull for the smallest minority, the happy few....
Commercial programmers have only one incentive: to sell as many copies of a program as possible, they have to cater for the people with low end machines, otherwise they'll be faced with hardly anyone bying it. As long as someone is looking after this majority of anonymous users the Atari platform will be more then just a virtual platform. Scare away the programmers, advice anyone not to buy commercial software anymore and all what will remain is a small group of people using their Atari to run stuff which in general performs better on different and more powerfull platform in the first place.

>Imagine: You are developer of OS that have to be compatibile with some older
>OS. You know that there are some programs that brake/abuse rules of those
>old OS. What can you do?
>
>1. You can bash that programs
>2. You can modify your OS to allow this abusers/breakers to run.

All this is nice to know, but from a users viewpoint is meaningless. If for example I run PhotoTip under MagiC or SingleTOS, it will do the job as it is promised by the author. Under freeMiNT is runs but I'm not able to use the output functions, as a user I'm not interested why exactly I can't print with this program under freeMiNT, all that I'll remember is that I can't use it...
One of the reasons MagiC has become so popular is that almost anything which has been developed the last eight years runs flawlessly on it. Even if the programmers had to resort to and implement "dirty hacks" to achieve this, it's absolutely not important from a user his viewpoint. If people here tell me that Calamus, WDialog, Papyrus etc are "dirty hacks" I believe them, they are much better placed then me, but once again, when running these apps under SingleTOS or MagiC there's no problem, so just like the anonymous majority all that I'll remember is that these apps don't perform as well as they should do when used under freeMiNT.

Which brings us back to the start of this post: freeMiNT might be the best OS on this platform, but in practice it doesn't show... as long as that doesn't change it will never gain the popularity which it possibly deserves. Another thing to consider is if people upgrade to MiNT to make the installation a bit more user friendly, and last but not least (although you disagree), the apps should come with a pleasing interface and the Atari looks and feeling. People who upgrade don't want to have a feeling that they are actually downgrading, I'm not saying that the quality of the apps isn't good, but it's the general

perception... someone who's been using GEM apps for years, has been spoiled by various protocols and standards which make computing on a Atari fun wont feel very comfy having to deal with what the ported apps offer.
Unless that doesn't happen in the near future, freeMiNT will remain a OS used by a small minority of the users, and I don't consider that small group to be the Atari community, it's just a small part of the community making a lot of waves.

Cheers from Belgium

No, it doesn't. It's possible to protect the OS itself if you have a 030
if you use a special tool by Uwe Seimet (atleast I believe it was he who
wrote that tool), but that's it.

> WDialog? Because it doesn't like Memory Protection? If that's the case,
> maybe that's why it works for me. On my Falcon, I can't use a
> memory-protected Mint.

I don't know why you can't use memory protection on your Falcon, but it's
probably because of some TSR or application you use. Wdialog is one
example - it will not work with memory protection due to it's design and
will probably cause a crash if MP is enabled.

>> Then you can separate further, mint and magic although really close now
>> with latest versions are still incompatible, some calls like pexec() are
>> not the same. What is a coder supposed to do? which one is correct?
>> What documentation should the coder follow?
>> There are many inconsistancies like that.

If you want your application to work on both platforms, you'll have to
code for both. It's not an ideal solution, but it's just the way it is.

> Sounds like the authors of Magic and Mint need to have some kind of
> discussion about standards...

It should have been done years ago. The last changes to MagiC was to
implement some calls that exists in MiNT, but now it doesn't look like
MagiC is being updated at all. MiNT is pretty much compatible with MagiC,
but many of the things that differs MagiC from MiNT is AES-stuff, so you
can't solve everything by modifying MiNT. However, N.AES implements all
(atleast I think it's all) of the new object-types introduced in MagiC,
and I believe XaAES does so too. The things missing are threads (which
oddly (from a MiNTer's point of view...) enough runs at the AES level) and
support for some special messages sent to AESSYS.

From a programmers' point of view it's not difficult to make an
application compatible with both MiNT and MagiC, as long as you don't use
any of the MiNT-only features (e.g. TTYs, which doesn't exists in MagiC
IIRC). Atleast in theory... In real life it can be tricky, because neither

MagiC nor MiNT/N.AES behaves *exactly* like documented. Also, many important applications (like Jinnee) behaves differently under MagiC and MiNT/N.AES, making it a bit fiddly to communicate correctly with them.

>>> manual that will not find one that guarantees you the application runs under
>>> MiNT... The truth is that the AES can't cut it, a nice example is Papyrus,
>>> the
>>> toolbar contains coloured icons, guess how they they look under MiNT? Ask any

Hmm... The AES is ofcourse able to show coloured icons, the problem is Papyrus that doesn't check for this the correct way. Unfortunately there are lots of applications that take short-cuts like this, and this goes both ways. E.g. that's why my own Taskbar only works correctly with N.AES... I wouldn't blame that on MagiC.

>> Did papyrus follow atari standards for their apps?
>> I seriously doubt. Making a c-icon toolbar following atari standards is
>> not that hard, but then, if I remember it looks all weird in magic (with
>> way too big border 3d effect on the icons)

Not quite. This is a complex issue. When "3D"-support was first introduced in MagiC, Atari hadn't even released (or perhaps just released, this is a long time ago so I really can't remember the excact dates) an AES that had this. So Andreas Kromke invented his own standard, which was to draw the border inside the object. This means that even old applications can have a 3D-look with very small modifications to the RSC-file. The downside is that there's less room inside the object, i.e. there's not always enough space to draw the actual object without overwriting the 3D-border.

Atari OTOH draws the 3D-border on the outside of the objects, which leaves the object untouched but can overwrite other object's border if they're very closely spaced. A bit of a dilemma here... Atari's solution is better for applications designed with a 3D-look in mind, but makes it a bit more difficult to modify older RSC-files. This really shouldn't be a problem at all, if it hadn't been for the fact that many programmers designs their 3D-resources under MagiC, and put the objects too close together for the Atari-standard. This is why some relatively modern apps looks odd under N.AES/MultiTOS/TOS but fine under MagiC.

> I agree. There needs to be a "meeting of the minds" between the authors of
> the OS's/AES's, and some standards set in stone that everyone follows. Then
> again, whose standards are the ones to follow? My vote would be the ones
> that are compatible with the most TOS (not Magic-only or Mint-only)
> software.

Which OS runs most TOS-apps has nothing to do with the APIs, but which OS contains most kludges and hacks to support broken and badly written software. Both MiNT and MagiC is virtually 100% TOS-compatible at the API-level.

> What about threads? These were born in MagiC also, these threads are Solaris
> compatible, it's not like Andreas Kromke reinvented the wheel and implemented
> a complete non-standard protocol.

These thread implementation is part of the AES and haven't much todo with
FreeMiNT (FreeMiNT doesn't include a VDI or AES that can be compared
against the MagiC VDI/AES).

> A bit later on, the freeMiNT developers also
> implemented threads, but decided to make them Posix compatible.

Please note that the POSIX thread library are user level threads and have
nothing todo with the kernel. Beside from that the POSIX thread library is
the most supported thread API from GNU software. The reason to port it was
to port other GNU applications too, not to force GEM programmers to use
it.

> BTW: Seriously: Is the MagiC PDLG.SLB (Wdialog replacement) also a "dirty
> hack"? I suppose that someone has tried using the SLB instead of Wdialog
> under FreeMiNT?

This so called PDLG.SLB isn't a SLB at all. It contain no SLB function.
It's AFAIK a (MagiC dedicated) AES extension. I don't know why it's named
.slb (I think it save some code for initalization as .slb files are
executed as kernel modules under MagiC).

Tschuess

> a complete non-standard protocol. A bit later on, the freeMiNT developers

What?? MagiC-threads are spawned with the shel_write()-call, I don't
think that's very "Solaris"... Also, MagiC-threads runs at the
AES-level, each thread is it's own application. You won't find an
equivalent in Solaris. I'm not saying that MagiC-threads sucks (they
don't, but they're hard to use. Threading is a very difficult
technique, which is probably why almost nobody use it.), but they're
not "standard" as you suggest. When/if Andreas Kromke talks about
Solaris-threads, I think he's talking more about the concept than the
API.

Another thing is that MagiC supports the same Pexec-modes as MiNT's
"threads", so it is (or should be, I've never tested it myself)
compatible with MiNT.

> implemented threads, but decided to make them Posix compatible. There will

MiNT doesn't have proper threads yet I think. You can fake it though
(I believe it's done in a library), but like MagiC the problem isn't
the kernel, but the libraries. We don't have thread-safe libraries,
and we don't have shared libraries, so threading is mostly useless.
Again, threading is a very difficult and tricky technique,
implementing support for it in the kernel is probably easier than
writing real apps that use it... How many applications use threading
today?

> If a programmer wants his program to run using the threads, then it will
> either run under MagiC or MiNT, but not on both, in practice this means that
> hardly any programs are written which use threads.

MagiC should run "MiNT-threads" just fine from what I've read in the
MagiC-docs, unless MagiC doesn't behave as documented. But MiNT won't
run MagiC-threads, simply because MiNT isn't an AES.

> BTW: Seriously: Is the MagiC PDLG.SLB (Wdialog replacement) also a "dirty
> hack"? I suppose that someone has tried using the SLB instead of Wdialog
> under FreeMiNT?

PDLG.SLB is the only sensible way to implement something like WDialog,
atleast if I understand the implementation correctly. Ofcourse,
there's no point in trying that SLB under MiNT, since there's no AES

for MiNT that actually *use* it. I'm not sure if the API for PDLG.SLB is even available.

With MiNT there are other and different solutions, N.Dialog for N.AES, and XaAES, which Henk says will support the WDialog-extensions natively.

Good question. I have no idea why some people like to torture
themselves and use this nasty little hack.

> Are you trying to tell me now that freeMiNT is missing some necessary calls
> which are present in MagiC, TOS and Geneva? I'm no programmer but AFAIK

I don't think MiNT is missing anything that's present in MagiC, and it
definitely supports everything in TOS (remember, we're talking about
GEMDOS here). But there's a lot of things in Geneva that's missing in
N.AES and MagiC, many things in N.AES that's missing in MagiC and
Geneva etc. Most of these are related to process and application
control.

> WDialog is an extension ment to enhance the features of the AES, from where
> I'm sitting I think something isn't quite right in N.AES and/or the other
> freeMinT AES's. Wdialog isn't the only program that conflicts with these

Hehe... Well, you said it yourself, you're no programmer. But even for
a non-programmer your logic is strange. Wdialog works with TOS but not
N.AES, MultiTOS and Geneva, hence TOS is the only OS that's "quite
right"? The correct answer is ofcourse that WDialog is written for TOS
and it's various flaws and bugs, and without regards for a
multitasking OS. Ofcourse this will cause problems. WDialog is a
horrible hack in a multitasking OS, and should be avoided if possible.
I can also list a few other "essential" utilities that falls into this
category, but I won't.

> AES's, you may call them a dirty hack as much as you like, the fact remains
> that apps which have a problem under freeMinT/AES usally run just fine on
> the three other OS's.

Perhaps you're right, although it's definitely not correct in my case.
But I'm not really surprised, MiNT is quite advanced compared to TOS
and MagiC, and emulation of ancient bugs and flaws does not have high
priority.

From: gregory@_SPAMMING_is_A_SIN_.atari.pl
Message-ID: <aakb5a$r00$1@news.tpi.pl>
Source record: 35361

Hi,

Some people here had certain problems with aIRC running with
MagiC/MagXNet (ie. it hanged in a very bad manner). If anyone
wants to use aIRC with this setup: you have to remove all
MagXNet gateways (Draconis and Iconnect one) leaving only
Gluestik. aIRC crashes when any other stack than STiK is present.

That is why it will *not* work with IConnect and IFussion, because
here you cannot get rid of IConnect itself. The only way to use
the current aIRC version with MagiC is to install STinG or MagXNet
(with Gluestik as the only gateway).

Just thought someone might need that info before the next version
with that bug (hopefully) removed is released.

Definitely not enough room. You could either have it recased, or have it as an external PSU, with cables running into the case.

I've recased my Falcon into a mid-tower instead of a tower in order to replace my broken Falcon PSU with an AT model. It took a bit of metalwork to accomplish, but it looks good. Still have a few things left to do, though. I have to make extender cables from the ports to the back, then cover the back. It's just gonna take a little time. But if you'd like me to show you how it's done, just let me know!

There is a game called Captive that is a SciFi game that is played like
DM. Have not tried it out yet. There is also Bloodwych, which looks good.

Vido (from Yescrew group) on his Milan040. Running MiNT, Naes and the
whole shabang. I am sure Swe would give you his email address as I lost
it.

Yeah, Dennis, doesn't seem to know what a database is supposed to do.
Oh well. Ain't my loss. All what I learned from MySQL, I now apply it on
IBM DB2 at enterprise level.

As far as I know, MySQL latest versions should compile right out of the
box on MiNT with gcc.

it is not comparing apples with pears.
Both these applications are Content creation. Photo retouch, whatever.
They are in the same categogy.

The only thing I would have to tell you is this:
I don't know any native atari graphic program that support Layers.

Period.
No further comment.
Nothing to see, please move along.

hm you need to get your story straight.
Do you wish the users to keep their 520ST? or want them to have something
a little more up to date (by 1995 standard at least). We are in 2002.
I didn't know we were in the imbedded system world here.
Hardware updates have been offered for more than 15 years.

hmm. No comments here as you are not a programmer.
Hell, even just as a user, you should understand the clear advantage
tcl/tk has over GEMScript. but you don't.

> fact and let it rest?

I accept that it's buggy and I don't use it. Having to boot to
singletos is simply unacceptable at least to me and probably others.
If that is the trend might as well stick with an old 520st and a mono
monitor. You choose to avoid command line driven apps, I choose to avoid
anything that relies on wdialog. I see constant complaining about cli apps,
so a little negative feedback about wdialog ain't gonna hurt anyone. It
seems rather justified actually, especially when some of these apps are not
free.

> Are you trying to tell me now that freeMiNT is missing some necessary calls
> which are present in MagiC, TOS and Geneva? I'm no programmer but AFAIK

There you go, you are not really qualified to comment. If some coder
decides to use wdialog, then that coder has made a very narrow mind
decision, not done his homework, or chooses to limit his audience.
Worst case senerio is some coder might see the thread here and get
informed... and decide to use some other AES extension that works
under all situations.

I heard that new hyp viewer requires wdialog, hense I won't bother
to download it and try it. Oh well, I'll stick to st-guide.

I've had some fun lately moving TAT to a new webserver, but it looks like everything has been ironed out. I'm also playing with some .php scripts for forms and polls... Hopefully more .php stuff (chat/messageboard/a new search) will be coming in the future.

In the meantime, there's probably some new stuff you haven't read since your last visit. And I'd also request you put my new poll through it's paces!

Thanks!

DV>Which brings us back to the start of this post: freeMiNT might be the
DV>best OS on this platform, but in practice it doesn't show... as long as
DV>that doesn't change it will never gain the popularity which it possibly
DV>deserves.

I have both freeMiNT/N.AES and MagiC 6.2 and I am *only* using freeMiNT while
MagiC is lying in my cupboard all of the time.
The main reason for it is that for me freeMiNT shows its advantages to me.
Well, with freeMiNT I have an OS that allows me to have several different
users with different desktop settings logged in at my ATARI. I can have
access to my other non ATARI computers in my network with MiNT-Net and I
have partitions I can access both under freeMiNT and linux/m68k.

Oh my- is there EVER a game called Captive..!

Dungeon Master in Space- Robots on the loose..!

I hate to say it, as much as I love Dungeon Master, but Captive is probably about .00001 ahead of DM as my favorite all-time game EVER.

It's played with Androids instead of Champions, and instead of giving them better armor you buy them better body parts.

No food or water needed, but you have to find electrical outlets on the walls to recharge them or they run out of power.

Be careful though- if you DO try Captive, you're likely to become very seriously hooked, for a long, long time.

NO ONE that I've ever heard of has EVER finished Captive.

It goes on, and on, and on and- eventually the police will break down your door to see if you're still alive, or the process server will slip your Divorce papers under the door.

It's rumored that the total number of levels is 32K (32768), although some people think it's 64K. One of the Captive fan web sites there were reports that someone actually talked to the creators of the game and they confirmed the 32K figure- I dunno..!

There are 10 planetary bases you have to explore, with the goal of destroying the shield generators, then there is a Space Station you have to invade with the goal of freeing your creator from his cell on the station. Of course, he gets captured again and you have to repeat the whole process for 10 more bases and another station, and again, and again, and again-

I originally played Captive on my ST and got through about 3 cycles of bases and stations before the police came and rescued me.

Then fairly recently I came across a mention of a PC version and downloaded that to try it out, but had some problems getting it to run, so I started using the STeem emulator to run the original ST

version on my PC.

I've made it through 5 cycles of bases and stations (that's 55 levels total, so far) and am running out of food- someone help me..!

Should anyone be so foolish as to want to find out more about this incredible game, try http://members.home.net/captivebase/

I had heard so many good things about NVDI that I finally purchased it from 16/32 systems. I found that it works well with CAB 2.7, speeding things up and allowing me to print images. I also found that I cannot print images in Atari Works, and NEWSie crashes (two bombs) when I send and receive mail. Are these common problems? My operating environment for this scenario is Falcon030/Geneva/NeoDesk4/STing. Things work fine with Speedo GDOS.

3828. Date program for Weblight Perl guestbook etc?

Newsgroup: comp.sys.atari.st
Date: 2002-04-30 09:09:44 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3cce6d56103ee20@tripnet.se>
Source record: 35379

I am experimenting with the guestbook Perl script under Weblight on my home page. It does seem to work with only 4 MB RAM.

My problem is that I have no "date" program so the guestbook entries get no timestamp. To quote the Perl script:

```
$date_command = "c:\\home\\bin\\date";

# Get the Date for Entry
$date = `$date_command +"%A, %B %d, %Y at %T (%Z)"`; chop($date);
$shortdate = `$date_command +"%D %T %Z"`; chop($shortdate);
```

I'm looking for a TOS program that runs with MagiC for this purpose.

>I have none of that software to test with, it might be a while.

Suggestion, at the very least have aIRC check what environment it's run under, and exit cleanly with an appropriate alert if it's not what is expected.

I expect though that people will be glad to offer their services as beta testers.

Cheers

Derryck

Don't forget to download and install the update to 5.03 from the Behne
website (English section), if the version you have is still 5.02.

>and allowing me to print images. I also found that I cannot print images
>in Atari Works, and NEWSie crashes (two bombs) when I send and receive

ISTR that AtariWorks has a problem with printing, pages have a black square
in the corner? Someone here might have the full story on this.

NEWsie has always worked without problems here under NVDI, although I don't
use it any longer.

Cheers

Hm, found it myself at the Julian Reschke page. His links were dead
though. The correct address for his tools in general and the package with
the date.ttp is:

ftp.uni-muenster.de/public/atari/Gemini/mupftl14.tos

So now the long date works in the beautiful German language...

Any English version somwhere??

It's OK, it's using both LUN's (Logical Unit Numbers), probably to use
two (or more) sorts of media...THe only other obvious thingn I can think
of like this is the Panasonic PD-650 drives that use one LUN for the
CDROM and the other for the MO drive...

Hehe, yes - these are two things I've found too and forgot to mention
in my tips to you!

My card reaader seems to be 'stuck' at ID 2, and yes it does have a
2.01 logical unit too. I found exactly the same thing as you, in that
rotating the selector doesn't have any effect on the ID. It must be
HDDRIVER or some other slight incompatibility with the Falcon.

I did post about this initially but I didn't get any replies to the
issues.

Hi all

I've always had a small Atari section on my web site - mainly photos
taken at Atari shows.

Anyway, I've moved ISP etc etc recently so my old web site is defunct.

New URL for my web site is: http://www.kerslake.plus.com

New email address for me is: atari@kerslake.plus.com

Atari Memories page is a bit dated, and I will revamp in due course,
so revisit in a few weeks if you can.

Hi all

Impending house move means I have to very reluctantly slim down my magazine collection.

The PC mags have gone straight to the trashbin, but my Atari magazines deserve better so...

23 Dutch language ST magazines (A4 - 40+ pages) are available totally free to anyone that wants them. Only thing I ask is that UK postage via Parcelforce is covered (about 5 or 6 quid), or the mags are collected from East Devon.

The mags are full of interesting stuff, even if English is your only language they are full of useable stuff, and written Dutch is so like English you'll be able to follow what's going on anyway!

Loads of screenshots, photos, diagrams etc etc on a wide variety of Atari subjects.

Email me if you are interested. I'll wait a week before taking the scissors to them and pasting some stuff in my scrapbooks!

EML: mike@kerslake.plus.com

Best wishes
Mike Kerslake

Sure, ok.

> As for APP-line displaying them or not, check out the inf file.

These are all I have in that section:
=====
The following applications will not have buttons added to the AppLine bar:
AVSERVER
BUBBLE
FLOCK_OK
MENUINFO
OLGA
SEESTART
START
WBDAEMON
WINCOM
=====

> But since the user is not supposed to freeze or terminate SLB's,
> other than knowing that they're actually loaded in memory, displaying
> them in APP-Line isn't really meaningful.

I accept that, but I don't seem to be able to load any DIVX AVI's in
Aniplayer, so I started to doubt that the SLB was working. The fact
that I don't exclude them from Appline and they don't show at all
makes me think something's wrong.

I've sorted out my Magx.inf file following Derryck's advice, but it's
still no good for me B^<

> One of the best applications to find out what exactly is running and
> where and how much memory is occupied is SYSINFO 5.0, freeware, you

I've only got the shareware v4.01 of Sysinfo and it shows the SLB's
loaded. But while I was looking at what I've got loaded, I noticed
I've got BGH.PRG in my MAGIC\START folder. Can someone remind me what

this is...

Yes, I have some Atari formatted disks that already contain data, and it
would be convenient to be able to simply "touch" the disk so that I could
read that data from my PC.

I would certainly appreciate having PCformat mailed to me, thanks.

Message-ID: <fc53daf3.0204302237.25975dcd@posting.google.com>
Source record: 35304

Just got my SCSI/Link-T ethernet adapter from Roger at Anodyne Software. Unit is like new, shipping was very fast, and as always Roger was on the ball when it comes to emails. Also upgraded to the latest CD Writer software. Can't wait to set this up on my Afterburner Falcon, but as luck would have it, I ended up with a compound fracture in my right arm last saturday by getting off at a local motocross track, so it will be a bit before i can reassemble my Falcon. Have to watch out for those realistic games:).
The effort from this guy will make my Falcon everything I could possibly want from this machine. And i thought it was at its limit several years ago with an afterburner and nova card. After the 060 is installed, it will be the dream machine i've wanted since it was new, way back then. My Quadra will loose its position as webserver to the Falcon in the very near future. Falcon on a cable modem, what a blast:)

For sale from another Had&#65533;s freak : Had&#65533;s 60, 64 Mo ram, ATI graphic card,
+ hd = 5340 Euros + shipping.

No, it's not mine, I never sale my Ataris.

Regards

>I received my Falcon with no software. I have a General Setup CPX, but
>there is no option for the CPU cache. Perhaps the one I have is for ST?

Very likely, there should be a popup menu under a box called "Chip Select". OTOH
the CPX I'm using was supplied with my CT2 card.

Cheers

Derryck

3859. Avalon 2.1 sample transfer bombs

Newsgroup: comp.sys.atari.st
Date: 2002-05-01 16:09:28 UTC
From: rezx0x@yahoo.com
Message-ID: <5851020c.0205010809.3f7fcb8a@posting.google.com>
Source record: 35312

Hello,

Avalon 2.1 keeps crashing every time I try to transfer samples.

Here's my setup:
Atari 1040 STe
Steinberg Avalon 2.1
ICD The Link 2
Akai S1000 (Adaptec 5500 SCSI)
External SCSI case (Seagate ST138N, Quantum ProDrive ELS, IBM CR-506-B CD)

I'm getting 3 bombs for SCSI and 2 bombs for MIDI!

I even tried setting the "MIDI via SCSI" option on the sampler, but with no luck.

I have tranferred samples to the S1000 with Squash It! (MIDI)

Also, there seems to be a conflict with GenMouse.

Any ideas as to why Avalon is crashing?

Lemmeknow,

You are exactly right, such people feed off the replies, that is the goal,
sad as it is. Mastering one's kill file will cure the problem and the
offending poster will get bored eventually.

It will have to be tiny indeed. The existing power supply is roughly
4" by 5" by 1.5" (this is a real rough indicator as I didn't bother
measuring it), and I suspect that Czuba intends to use the power pins
on the Falcon motherboard to support his card. If this is true, you
are looking at less than a 3" by 5" area to squeeze in your power
supply.

Personally, I'm going to bolt my power supply to the underside of the
desk and run the cabling through a flexible plastic tube. As long as
the cable is less than 2 feet long, I don't think I'll have any
trouble with voltage drop. Does anyone have any knowledge of this?

That could be as the game does resemble DM, but the graphics are not as
good. That really does not matter as the gameplay is very high.

Looks as if you have configured HDDRIVER to scan the devices in another order than usual. Note that the ID check always scans lowest numbers first, regardless on how HDDRIVER was configured. So the order of devices can differ, but the SCSI IDs are always consistent.

> change the ID from 5 (+ 01 LUN)! Is the unit faulty
> or is there some other switch that would work?

Does this unit actually implement two LUNs? This is unusual. It could either be a (minor and non-relevant) flaw of the reader's SCSI firmware or due to your version of HDDRUTIL/HDDRIVER (seems to be quite old) not scanning for LUN1 properly. Can you please check whether the current (demo) version reports two LUNs as well?

> The drive works like a dream (with a Compact Flash
> adaptor & 16Mb Card) - just like an ordinary disk,

Sounds good. Actually this is what one should expect, since as long as a device acts like a hard disk drive it's not relevant for HDDRIVER whether it is a real hard disk drive or something that only claims to be such a drvice.

But only if configured in the PC compatible mode. In the Mac compatible
Mode there is only one LUN and the device type reported depends on the
cartridge (PD or CD) that is inserted.

Perhaps it would not be a bad idea to have it in the Mint section on
some Atari ftp site, like chapelie?

>I don't know any native atari graphic program that support Layers.

In fact there are some. A rather old (but quite good) bitmap+vector graphic
program named Megapaint supports up to 4 bitmap layers and 4 vector layers,
with certain operations between layers possible, etc. (btw. they are not
-called- layers in Megapaint, but to all practical puroposes they are layers).

CAD programs (although they are "graphic programs" only in a most
general sense) like e.g. DynaCADD support layers, of course.

I do not have Photoline, but I think that it supports layers, too.

So there -are- native Atari programs that support layers; how comprehensive
and good that support is, that is another matter.

>I really find vi to be excellent. Make fun of me if you wish.

A debate of which editor is the best will never end, so be it for everyone
according to his personal taste :) E.g. I have heard horror stories from VMS
users of when they had to use vi, as opposed to EDT or EVE, and of their
relief when they got hold of unix version of EDT :) (btw. EDT or clones
are multiplatform too- VMS, Unix, DOS, Windows; though, EDT has its stupid
quirks, too, of course).

It would also be possible to use any disk editor on Atari and change
about three or four bytes in the boot sector in otder to make it readable
on a PC. But I can not now dig which bytes those are or what shoud their
value be.

Hi everyone,
Does anyone have any idea what has happened to Ulli
and co aka ROM Logicware. I have been trying to obtain a copy of
papyrus Office for the awful (but sadly necessary) Win box recently
obtained so I can swap files with my Falcon. I registered and paid
for the latest version of papyrus office for Windows, and incedentally
will be upgrading my TOS version also if ever someone gets in touch.
To be honest it is unlike Ulli not to get in touch and I am getting a
little concerned.

Any information would be gratefully recieved. I have E.,Mailed many
times and FAX'ed also to no avail.

Many thanks.

James

I have no personal knowledge to the contrary, but I would tend to seriously doubt that. I worked with the FTL group for a while, and they never mentioned licensing their engine to anyone else.

Bloodwych was created by a group from the U.K. and has a very different "feel" from Dungeon Master, both in the graphical appearance and in the gameplay. Also, it can be played as a 2-player game with a split-screen and 2 sets of controls, which Dungeon Master never had.

It IS an excellent game in its own right, but I don't think it's any direct relation to Dungeon Master.

It's sufficient to boot from a floppy disk without starting any hard
disk driver. You can then start HDDRUTIL from floppy disk and run the ID
check. There is no need to install anything.

I think it depends on the robustness of your power supply. I once bought a HP inkjet cheap and found it was a grey inport with European power supply. It worked OK. I think in theory we are all a nominal 230V or some such (although the permissible limits had to be stretched so that the politically correct single voltage standard would accommodate all European ranges).

It's just two bytes in the boot sector. I think one is EA (hex value not
position)

They're easy to change, I used knifeST. All you need to do is look at the
boot sector, I think the bytes to change are in the first ten, & note the
differences between the bytes. Then change the ones on the Atari to match
the PC's. I used this regularly. I think PC formatter will format the disk
thereby losing your data.

Hello,

Could anyone tell me if it is possible to run a European computer on the UK
power system, the machine in question has a 220V power supply, but the UK is
240V, will the computer survive if plugged into the mains in the UK?

I share the opinion of JI Logan because even if the power is supposed to be 220v in France, I mesured 210v in the early morning and 235v at 13h.

It is possible that this unstable voltage is dammaging the electrical stuff and electricity compagny knows and nobody bother : dead things cause buying new ones isn't it ...

Pretty much the same in the UK. It's not damaging to the equipment. Most electricatical items are built to expect some sort of fluctuation in the power supply, for instance, my computer can happily run between 210 and 240v with no problems. It's near impossible to provide a steady voltage through the powerline network.

And, the UK power supply averages 230v, but does fluctuate.

I think most appliances allow a tolerance of 10-25% in the voltages due
to their components.

Hmm! Perhaps he has decided just not to respond any more! All I
really want (for now) is a registered copy of the current version for
PC but I can continue very well with the TOS version I guess, it's
just a pain at the moment swapping monitor plugs from one machine to
the other. I suppose I should get a monitor switch box!!

thanks for reply

If you mean to go to a "PC" type monitor then its simply not possible to
make an RGB
connection. If its an old EGA/CGA then it won't work at all. If it is VGA
then it may be possible
to drive this in MONO (so not RGB).

If you want RGB on say BNC connectors then that is possible, but soldering
the dreadfull DIN
plug is not easy. I would be inclinded to get a SCART lead (the ST ones are
RGB anyway) and
hack that.

The power supply in the UK is now supposed to be 230 volts, and it should
also be 230 v in the
rest of europe due to EU standardisation. However this is a bit of a fudge
as the tolerences are different.

I though that the standardisation in the rest of Europe would take place
in 2004 or 2005... And if all is right, electrical machines were already
adapted for 230V since 1992 or 1993.

I have seen one before, but I believe it would only do mono. I
indirectly hooked my STe to a color VGA monitor using a video converter
and an old piece of hardware for the ST called Video Key.

Hello,

For all those wondering what to replace TT's and MegaSTe's battery :
just open the battery's case and replace the battery in it with a
3.6 V lithium one. Just two wires to solder, works great.

Date: 2002-05-03 21:26:50 UTC
From: John Perez <jhperez@uhunix2.its.hawaii.edu>
Message-ID: <aauvaqlqb1@news.hawaii.edu>
Source record: 35282

Greetings,

It took me a long time to find this address, so I decided to post it here
so anyone else may be able to find it.

Here is the address for the final release of Sound Diver for Atari ST:
(Note: This will only function if you own the copy protected diskettes and
can authorize the software)

ftp://ftp2.emagic.de/pub/sounddiver/atari/SD206E.zip

Aloha!

3931. Re: European Computer on UK Voltage system

Newsgroup: comp.sys.atari.st

|> The power supply in the UK is now supposed to be 230 volts, and it
should
|> also be 230 v in the
|> rest of europe due to EU standardisation. However this is a bit of a
|fudge
|> as the tolerences are different.
|
|I though that the standardisation in the rest of Europe would take
place
|in 2004 or 2005... And if all is right, electrical machines were
already
|adapted for 230V since 1992 or 1993.

The old voltage was a nominal 240V plus 10% and minus 10% say. This gives a range from 264V to 216V. The new voltage is a nominal 230V plus 15% and minus 6% say. This, quite by chance :-), also gives a range from 264V to 216V. All the other European countries make similar "technical" adjustments and we all have a standardised power system at very little cost. Amazing.

> sinclap!

Hey plonker,

how many times does everyone here hafta tell you beg borrow or buy a clue. Get your fact straight for once in
your life. I've participated in the local user group for severa years. You harass and make a laughing stock of
yourself. I and many others who pop into this newsgroup and others know the facts when they see them. You on
the other hand describe yourself perfectly as "blowhard with nothing better to do". While I and everyone else
here does have a life outside of laughing at you and your imaginary friend chunks. This does not make myself or
anyone else into "jihads". You've been babbling conspiracy theories about "atari jihads" which you foolishly
think are "out to get you". Not to mention all the amiga users you've tried to provoke over the years.

It comes down to this, many here have made valued contributions to the Atari scene, and the classic computer
scene as a whole. Whereas you've given a few of us a pathetic example of a gormless kook. I must admit
sporking you has been entertaining at times. But those times are coming to a close. Mainly cause you're too
stupid to realize you've lost years ago and run out of original ways of showing yourself as a kook. Now your
nothing more than the online equivalent of the 8 track tape of polka tunes thats been warped by heat and age.

3937. C-LAB Falcon For sale.

Newsgroup: comp.sys.atari.st
Date: 2002-05-04 01:22:05 UTC
From: drojo1@lycos.co.uk
Message-ID: <fa3f7acf.0205031722.239ad10@posting.google.com>
Source record: 35289

I am selling my C-Lab Falcon MKX.

Specs:

- 14Meg RAM (Wizztronics board).
- 121 Meg IDE HD.
- 68882 math coprocessor.
- Internal SCSI connector (add any 3.5'' SCSI inside). I have a 1 Gig SCA
disk that started giving some troubles, but I can include it, if requested by the buyer.
- External SCSI IOMEGA Zip100.
- External TT keyboard.
- Multisync monitor adapter (good for VGA monitors).
- Nec SCSI CD-ROM (1x).
- Assorted software including HDDriver, MagiC 6, Papyrus 8, Cab 2.7, PIXART,
Artwork, and games: Ishar I,II,III, Zero-5, Conquest of Elysium (registered), Zero-5, Running, and more...

All is in good shape.

I am asking for US$400 + Shipping from Zip 77550.
US buyer preferred.

I'll be happy to answer any questions to my e-mail: drojo1#lycos*co*uk
(replace "#" with "@" and "*" with "." to remove the spam protection)

Thank you.

Daniel.

Maybe that's crazy, but I have the battery case completely removed,
and four *standard AA-size* batteries connected externally at the
back of my TT.... And it works! ;-) That gives 6 V, however...

>Falcon are getting horribly noisy. What's the best way to fix these?

I only know about Falcon so someone else will have to talk about
Mega ST. The Falcon has slim 40mm fan, like old 486 fans. It
needs the metal to be removed, with solder sucker IIRC. It may
be possible to undo bolts and slide it out actually. I removed
it, as it was noisy and my Falcon is in a PC tower.

I don't know... If the case can be opened, then it should be possible
to replace the old element with a new one. I think 6V Li batteries
can easily be found, can't they ?

Well, you first could try using 3x 1.2V CdNi elements : it these
keep the clock saved, just use a 3.6V Li, as I previously described.
If the 3x1.2V cells are too weak, just find a 6V Li battery.
It would, of course, be possible to use ordinary 1.5V alkaline
batteries, but you then would have to replace them more frequently
(every 2 years, I think) than a Li battery (5 years, at least).
One last thing : a 6V Li battery is about 6 euros, 4x1.5V alk. are
about 4.5 euros.

Hmm

I wonder!!!

I have 3 different publications of the same type, maybe the original was
the old published version!!

i have 2 book series published by 1st publishing limited - 1 in hard
back, the others in paperback/softback, then there's the common abacus
ones!!

I'd like to finish off all 3 series, i'll list the others when i can:)

Hi Tim,
Hopefull this post will trigger the right resister value from another user.
I read somewhere a resistor tied to ground would lower the voltage to the fan, slowing it down and causing it to run quieter. I dont know if this would cause grounding problems elsewhere however, never tried it myself. Using a glue stick gun and soldering iron, a small fan from radio shack can be mounted between the powersupply shielding and outer case of the Falcon. OHMS law should provide a value to drop the voltahe of the stock fan a few volts.
Mike

You do mean that the resistor should be connected in *series* with the fan, I
hope :-)

I'd guess a value of about 47R. Too big and the fan won't start.

Cheers

Derryck

Hello,

I will place my order when I am certain the English version 9 is ready.
Version 8 is serving me just fine, so I can wait awhile.

Hi folks :-)

> > I've visited a few pages of your site and so far I haven't found any
> > English pages. Also the demo I've downloaded is still all French.
> > Am I doing something wrong?

Hmm... Maybe you could try this simple URL : http://m.demange.free.fr
There is an only link to the Organizer website's first page which allows you to select your language. Then you should find the partially-translated website
about Organizer, and an english demo...

> > Anyway many thanks for supporting the Atari platform.

A real pleasure... Atari is a part of myself since I'm 4 years-old ;-)

> I downloaded the demo as well, but although a few menus were translated
> into English, most of it was in French, so I'd hardly call it an
> "English version". Sorry :-(

Oh ! Damned... I did this work very quickly to satisfact as more as possible.
Could someone tell me quite precisly what is missing ? I really would like to finish that work and make it accomplished instead of "fastly presented".
I also know my english isn't the best so if someone want to suggest some better translations for Organizer (and/or its website), please contact me !

> I also found it strange for a shareware program not to mention anywhere
> how much the registration is and how to register. A new type of free
> shareware ;-)))))

Well, I know about this and these informations are currently available in pages which are NOT yet translated ! This is also why I've got to hurry up !
For now : Organizer's registration fee is 15 Euros. You can obtain my snail-mail address in the 'About' dialog of the program. In the french website, I also mention that as Organizer is not yet at version 1.00, I will give all releases for free until it will be at version 1.00 for those who
register. Time for me to build up a nice french/english/german printed documentation. The program will be even available on Europe Shareware's catalog.

Hmm... I think that's all, but it's 1 hour AM and I'm a little bit tired so if something is still not understandable (I would not be surprised regarding my english skill ;-) please contact me. And just do so for any question, suggestion,
etc...

Good night ;-)

Mathieu

>John G.

Actually, the patched version of the Atari Hard Disk Driver came with
Audio Tracker. I've not tried it because I use HD Driver (and ICD Pro
if needed, by booting from a floppy with the ICD driver to
overide/bypass HD Driver).

I've never tried Atari's hard disk driver, though maybe I should.
Although I'm not sure how difficult this would be, unless I could do
something like I do with the floppy / ICD stuff, since HD Driver is
"installed" on my hard drive. I don't want to have to manually
un-install it when I want to use CAF, then put it back when I'm done.

Hi Harry,

>I've only got the shareware v4.01 of Sysinfo and it shows the SLB's
>loaded. But while I was looking at what I've got loaded, I noticed
>I've got BGH.PRG in my MAGIC\START folder. Can someone remind me what
>this is...

Sysinfo 5.01 is now freeware, you can download an English version from the
Chapelie ftp server...
BGH.PRG is part of the GEMbubble help package, there should also be a line in
your magx.inf file referring to it:
#_ENV BGH=C:\GEMSYS\MAGIC\START\BGH.PRG

>The fact hat I don't exclude them from Appline and they don't show at all
>makes me think something's wrong.
>I've sorted out my Magx.inf file following Derryck's advice, but it's
>still no good for me B^<

If they don't show up then there's definitely something not right, check that
the Magic extension folder located in GEMSYS/MAGIC is called XTENSION, next
compare the following lines in the magx.inf file...

#_ENV MOVIEPLAYER=D:\ANIPLAY.219\ANIPLAY.PRG (path of Aniplayer)

#_SLB 0 EDITOBJC.SLB
#_SLB 0 PDLG.SLB
#_SLB 0 WINFRAME.SLB
#_SLB 0 BGH.SLB
#_SLB 0 JPEG.SLB
#_SLB 0 OPENDIVX.SLB
#_SLB 0 LAME_ENC.SLB
#_SLB 0 VORBIS.SLB

If the MagiC extension folder has a different name other then XTENSION, then
only the standard SLB's will load, but the ones not belonging to MagiC wont...

>I accept that, but I don't seem to be able to load any DIVX AVI's in
>Aniplayer, so I started to doubt that the SLB was working.

Hm, my success rate isn't very high either, on average only about 1 in 15 DiVx
AVI's can be sucessfully viewed with Aniplayer. There are a lot of DivX video-
content standards from prior to alpha 3.1 up to the very latest DivX 5.0 Pro
standard. I've no idea what exactly is supported by the OPENDIVX.SLB but don't
get your hopes up to much, GNU software usally leaps behind....

Another problem is if the file contains sound in MPEG4 advanced format, (VBR)
variable bitrate or Microsoft MPEG 4 format then you're out of luck as well.

Cheers from Belgium

>> news:<1019764276-182095AEicMi@gmx.net>...

Hey.... your killfile slipped up again :-/

>>or hinted that WDialog would run under MiNT. Why can't MiNT users
>>accept that fact and let it rest?
>
>I accept that it's buggy and I don't use it. Having to boot to
>singletos is simply unacceptable at least to me and probably others.

That's where we differ from opinion... I think it's great that we can at
all times revert back to SingleTOS. If I've got to choose between running
an application in SingleTOS or not running it at all, then the decision
will balance in favour for SingleTOS.

>If that is the trend might as well stick with an old 520st and a mono
>monitor.

??? I can use the full 128Mb memory in 1280*1024 16bit under Single TOS
as well, reverting back to SingleTOS doesn't mean reverting back to the
stone age. When running applications like i.e: Calamus or Photoline then
it doesn't even make much difference if it runs in multitasking or
singletasking. Both these apps garble up memory, so there's hardly room
left to run anything else in the background. Keep in mind that most of the
users don't have access to 128Mb either...

>You choose to avoid command line driven apps, I choose to avoid anything
>that elies on wdialog.

True, but the difference is that *if* I decide to give the the CLI apps a
go, I can :-)

>I see constant complaining about cli apps, so a little negative feedback
>about wdialog ain't gonna hurt anyone.

A little negative feedback? WDialog has been the favourite topic here for
many years as an example of a "dirty hack". And since it was never ment
to run under freeMiNt it's not a good example.

>It seems rather justified actually, especially when some of these apps
>are not free.

Here we go again... :-(
Just because an application has the commercial status, it's justified to give it negative feedback? Are you serious?
If the programmer or softwarehouse would claim that it runs under MiNT, well, yes then I agree... bash it. But, if like in most cases this is not claimed then you should accept it and not moan about it. The fact if it's commercial or freeware is irrelevant, freeware using the WDialog routines wont run either...

>>Are you trying to tell me now that freeMiNT is missing some necessary
>>callswhich are present in MagiC, TOS and Geneva? I'm no programmer but
>>AFAIK
>
>There you go, you are not really qualified to comment.

OK... I'll put a sock in it.

Cheers from Belgium

Source record: 35165

Hello,

since yesterday I own a Atari SLM605 laserprinter :) It works fine,
but I have a slight problem with it: it prints an echo ... for example
if I print an A4-sheet with only one line a the top, this line is
repeated faintly somewhere in the middle of the page.
Has this something to do with a malfunctioning charger/discharger
wire?
I think the toner and drum are OK.

best regards,
Dennis

3964. Riebl ethernet card + MagnumST card together?

Newsgroup: comp.sys.atari.st
Date: 2002-05-05 08:27:48 UTC
From: d.w.vanderburg@student.tudelft.nl

Source record: 35166
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I would like to know if it is possible to use a Riebl ST ethernet board together with a MagnumST card in a Mega ST 4? (The magnumST card is a 8MB (in my case) memory expansion set which uses SIMM memory + TOS 2.06 upgrade). Both are connected onto the Mega Bus. I'm afraid that both cards want to use some overlapping memory area between 4MB and 14MB because the system won't boot (black screen) if I turn it on with both cards (with one card it's OK).

best regards,
Dennis

>>My Atari's are showing their age. The fans on both my Mega ST and my
>>Falcon are getting horribly noisy. What's the best way to fix these?

It is not worth the trouble trying to repair (lubricate, etc.) the fans.
They are quite standard devices and new ones can be found in most elecronic
shops. They are supplied by 12V DC and some soldering is required to connect
the wires to points where the wires from the old fans were.

Note that the fan on (at least mine) Mega ST is about 40x40x20mm; Such can be
found for sure, but there are also fans with about 40x40x10mm size (intended
for on-chip coolers); in my experience such fans are louder and deteriorate
much more quickly, possibly because of the unfavourable (small) distance/length
of bearings. So, at least for a Mega ST, it would be better to stick to
original 40x40x20mm fan size; besides, the original screws can be used then
to fix the fans.

Btw. fans might almost be considered expendable equipment- they are cheap
and it is not much trouble to replace them once in a couple of years-
there is a worse thing than a loud fan: the bearings can seize and the fan
can stop which can pass unnoticed, with possibly disastrous results.

Look for fans made by Papst. They are very quiet

http://www.xpcgear.com/fans.html Has a good selection, and is US based.
Sadly, not 40mm Papst.

The point was: "It works both ways". As for diffrent thread model, I think
that it can be solved by library.

> BTW: Seriously: Is the MagiC PDLG.SLB (Wdialog replacement) also a "dirty
> hack"? I suppose that someone has tried using the SLB instead of Wdialog
> under FreeMiNT?

If I am not wrong, MagiC loads some SLBs at startup, but FreeMiNT don't.
This is a case of PDLG. I think that by looking to the docs how MagiC calls
SLBs at startup it would be possible to write such program for FreeMiNT.

I do not know how exactly PDLG.SLB works and how it looks in comparision to
WDialog, so I cant judge here.

> stay up to date about what's happening on this platform....

I said that Linux has about 5 millon of users. I do not know how many Unix
users are there.

There are lots of people on internet, but even if they are not using Unix
clones, they relay on them as most of servers around use Unix clons, and

even END-User systems mus have some things that came frome Unix world:
TCP/IP is one example.

As for POSIX is is an Portable Operating System Standard, and majority of
OSes areound follows it, and in my opionion it is a good habbit.

3972. Okami, Pop/Newswatch setup

Newsgroup: comp.sys.atari.st
Date: 2002-05-05 17:23:22 UTC
From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3cd56a8e429de0@madasafish.com>
Source record: 35050

Hi

I have created a zip of my Okami, and Pop/Newswatch setup. Grab the 700kbye file here: http://hardware.atari.org/setup.zip

Okami was on my D drive in a folder called Okami, Popwatcha nd Newswatch can be anywhere AFAIK. The main folders in Okami are In, Out and Store. In are emails or posts coming in ready for Okami to import. Out is folder for posts or emails to be sent, they are placed here after Okami exports them. Store is where your news and emails are kept.

First, get newswatch and popwatch installed. You'll need to modify nntp.dat for newswatch, and set up Popwatch, for the right passwords, server addresses etc.

Once Okami is copied, you'll need to go through with a text editor on o.inf. Look through every line and change to suit. Start off changing most important things like your email address, real name and if you change the directorys from the ones provided. Passwrd file on the root needs to be altered, but you don't need to put your email passwrd there funnily enough. Inside the info directory is where quite a few of the configuration files are kept. You'll need to modify joe.qfm and joe.sig. Others can be changed when you're confident.

I think there were hypertext help files for these programs, but I didn't include them as strangley they're not in my ST guide folder. Pop/Newswatch can be got from Gary Preistly website, Okami is Jos den Bekker.

Hopefully that'll help you get sorted, it really does pay off to use Okami, and register too! It's not expensive for such a versitile program.

<big cut here>

<still teasing>My ping was being better, not popular.</still teasing>

As for Phototip: do other programs have similar problems? Is not this is
Phototip problem, not FreeMiNT problem, and Phototip does something wrong -
it brakes/abuses some rules.

Hi Frederic,

>MagiC users, please speak aloud, I know you have been reading this 'now'
>long thread about magic/cli/gem/gui/sql.
>None of you really dipped in it. Why is that?

Personnaly, I don't have time to argue, why can't magic and mint
developers get together, and make things more compatible between
the two. There have been good attempts, like Magxnet which I'm
quite happy with.

I have tried Mintnet and Naes. It seemed slow, and the saying
that in Mint you can't take the OS out with a bad app is not
true, as it happened quite easily here :) I like the fact that
it is activily developed, but it seems too large as well.
I'm used to Magic, to use Mintnet, I'd need to learn all about
Unix style of partitons, all the stuff that goes in the u:/
drive, and then mint. I would, but I don't see any sites that
have this info. I always like to know exactly what file is
doing what, when and if it's needed. That's why I don't use
Windows.

My problem is that I have got a TT of the new type (I think), but with
the battery missing. So I can't simply replace it.

The obvious solution is of course to first try with three AA cells and if
that does not work use four.

The TT clock seems to draw a higher current compared to Mega ST's. My
1987 Mega2 still has the two original (non alkaline) AA cells in and at
least a year ago it still kept the time!

Hello,

Firt Word has the distinction of being the first program to be ported
over to the PC from the ST. My copy came with my ST. I do also have
First Word Plus, but cannot remember where I downloaded it from. It may
have came with a disk attached to an Atari magazine. If I did not have
Papyrus, I would be using it.

Hi all,

I finally got hold of my Atari TT, hmm not to chuffed.

It has a Ge Soft Mighty Mic 64, TT Ram card installed with xxMB ram on it.
When I boot up the machine, it counts up to 4MB of ST Ram and 16MB of TT Ram
then after waiting for the hard drive to spin up crashes with 2 bombs.

If I remove the card, the TT boots up fine.

Has anybody had this problem before?

Please help

Tim

Hi

As far as I know the original 'First Word' was released in the public
domain, 'First Word Plus' was released on a ST review cover disk but NOT
the latest version though.

: Hello,

: since yesterday I own a Atari SLM605 laserprinter :) It works fine,
: but I have a slight problem with it: it prints an echo ... for example
: if I print an A4-sheet with only one line a the top, this line is
: repeated faintly somewhere in the middle of the page.
: Has this something to do with a malfunctioning charger/discharger
: wire?
: I think the toner and drum are OK.

: best regards,
: Dennis

Nope, if that is adequate information. The transfer charger wire, the one on the bottom, probably, needs cleaning. The toner is not totally tranferred from the drum to the paper, and is still there on the next revolution. Or, the discharge lamp, usually a row of red LEDs, is not working well because it is somehow dirty.

Open the thing up, and clean it, and then try again. The wires get cleaned, very carefully, with cotton-tipped swabs, or whatever the local name for what I call Q-tips is. It probably needs dusting. A soft brush and a vacuum cleaner would probably do.

And, if that is is the only thing that it doing wrong, it probably does not need much help.

The MagnumST used the address space from $00400000 to $00BFFFFF. I am not
sure about the Riebl card - if it lives at $00C00000, it should work, if it
is below, you are in trouble.

The MagnumSTE has a jumper to limit the memory to 6MB for such cards.

> Do you consider Dennis the spokesman for you, being MagiC users?

Nope :-)

I use MagiC and I like it. I do not say it's the best OS and that
FreeMiNT is not! MagiC is just enough for my own current use.

About MySQL, I would like to have an Atari port (you says it exists) but
more than this one, I would love to have a port of PHP (3 or 4): does
someone tried to port this one? It would be very usefull to test some
scripts localy. Perl exists but is not usable with my FAI. PHP would be
great (for me) and I don't care if it run on FreeMiNT or MagiC.

Bye,
/Pascal/

3989. Atari TT -- One last try

Newsgroup: comp.sys.atari.st
Date: 2002-05-05 23:25:19 UTC
From: Tim Anderson <tanderson@ednet.co.uk>
Message-ID: <udbfrbfneqa644@corp.supernews.com>
Source record: 35187

Apologise to all for my last two posts, hopefully this will go to the right place.

I just got my new TT and am having a problem with the TT ram card.

It is a Ge-Soft Magic Mic 64 with 2 banks of 6 slots and one bank of 4. From what I have been told, it has 16mb on board and this certainly tallies up with what appears on screen.
When the board is inserted, upon boot it tests the ST ram (4Mb) then tests the TT ram (??Mb) the screen shows 4 and 16 with no crosses. It then waits for the hard disc. Once the time is up the TT tries to boot but ands up with 2 bombs (bus error?).
If I take the board out, the TT boots fine, in fact, it is formatting a hard disc as we speak.

I have tried swapping out the simms, I have fiddled with the jumpers on the card which ended up with 16Mb most of the time but on one jumper setting shows 4Mb.

I have looked on the net, On google groups and everywhere I can think of but can't find much about this card at all.

Can anybody help me?

Tim

3990. Cheap Motorola 68060 CPUs

Newsgroup: comp.sys.atari.st

That's a stretch, it's nothing like windows... there is not that
much to learn really, the word unix just strikes fear into people
for what reason I do not know. If you saw my mint setup, and missed
the boot up, you'd never know it even had the unix additions. I can
use it all day and never pop open bash. Heck I don't even login,
it boots directly to Thing Desktop. I never put anything in the u:/
drive, you must be confused what that drive is for.

Well, everyone agrees when it comes down to it whatever works for you,
works for you, fine and all be happy. When it comes to an OS that is, so
why post.

His other points about cli's and wdialog are just plain off the mark,
therefore nobody in their right mind is going to come forward and defend
those remarks. lol

Tim Anderson <tanderson@ednet.co.uk> writes:

: Apologise to all for my last two posts, hopefully this will go to the right
: place.

: I just got my new TT and am having a problem with the TT ram card.

: It is a Ge-Soft Magic Mic 64 with 2 banks of 6 slots and one bank of 4. From
: what I have been told, it has 16mb on board and this certainly tallies up
: with what appears on screen.
: When the board is inserted, upon boot it tests the ST ram (4Mb) then tests
: the TT ram (??Mb) the screen shows 4 and 16 with no crosses. It then waits
: for the hard disc. Once the time is up the TT tries to boot but ands up with
: 2 bombs (bus error?).
: If I take the board out, the TT boots fine, in fact, it is formatting a hard
: disc as we speak.

: I have tried swapping out the simms, I have fiddled with the jumpers on the
: card which ended up with 16Mb most of the time but on one jumper setting
: shows 4Mb.

: I have looked on the net, On google groups and everywhere I can think of but
: can't find much about this card at all.

: Can anybody help me?

: Tim

Probably not, but. Turn that thing over, and look carefully at the
connector pins. I once had a similar problem, and a pin was bent, so the
lowest bit was not there. The TT might check all the memory it can find,
in its memory check routine, and not find it in proper order when booting.

If that does not work, sell it to me, and let me worry over it.

Jim

There's a somewhat lengthy post from Dave Small in the following thread:

http://www.atariage.com/cgi-bin/ultimatebb.cgi?ubb=get_topic&f=20&t=000015

It focuses on the "fall" of Gadgets by Small, but there's other
information in there, too.

How do I kill an app without it? I don't mind using bash.
I used to use bash to run pppd to dial up with my modem.

>I never put anything in the u:/
>drive, you must be confused what that drive is for.

Hmm, I meant all the unix stuff actually, on the ext2 or minix
partition. As usually, you work through the u:/ , something
I've never really understood why you need to go through u:/
I also never found a fix to get my pallete right with NVDI
intalled. I also believe you can not print with NVDI under
mintnet. If/when I get a CT60 I will reconsider, but with only
14MB of RAM, it gets very tight with mintnet. I only had about
6MB left, not enough for some of my apps.

Atarians,

I am looking at either buying, or possibly building as there seems some delay with supply,
the Ethernet Interface described at hardware.atari.org (or at least it is when the site is up
it appears to be down today).

This is said to work with STinG, Mintnet or MagicNet, and as I am a novice in this area I was
wondering which might be the best to try as a novice user. My main aim is to allow quicker
transfer of files between the ST and my PC's. A second aim is to spend as little cash as possible.
And thirdly whilst I can order a train ticket or hotel room in German anything remotely technical
is beyond me so it should have good English documentation and support.

Thanks in advance for any suggestions.

Dave.

Try the info at http://www.algonet.se/~guld1/hardware/atari-scart.html
I know its for a scart lead, but you just need to change the scart
end to suit what ever the RGB/VGA converter requries.

So it it needs Phonos/RCA sockets connect the center pins as follows

6 - Green Phono
7 - Red Phono
20 - Blue Phone

And in all cases connect the ground/shield to pin 13. For the sound
use Pin 1 on the ST.

You may need to mess around with the sync to get it right. All the
SCART leads I have seen connect 2 + 12 via a pair of 47 ohm resistors
but some omit them.

I'm not sure. I think it might be something like VDI 4 was fine
with mint, but not NVDI 5. I never go around to playing with
the printer.

>True. My MiNT(net) setup really began to swing only after I got my CT2b
>and my added 32MB fastram. But now I couldn't live without it. Well, maybe
>now I'm over-dramatizing things a bit ;-)

The FastRAM I'm sure really helps there. Another thing I could
never find to alter was timeslice. I had a problem playing MP3
with my Mintnet setup. In magic MP3 took about 45%, but in
mintnet it took about 80% +- 20%. I searched about for these
answers, but didn't find anything much. I think I might try a
easymint installation.

Wel, I'm quite happy with my set-up. If I was using MiNT I would no doubt
be happy with that too.

I choose not to try MiNT as there's very little that it can do *for me*
that MagiC doesn't already offer. I also suspect that MinT will make my
system run a little slower whilst it checks if I have permits for every
file that it loads.

Cheers

With XaAES you can kill an app in the XaAES "taskmanager" menu, or you can open a U:\proc\ and drag processes to your desktop trashcan with the mouse, for example. ButpPersonally I don't mind using bash either. In fact I use it a lot.

> I used to use bash to run pppd to dial up with my modem.
If that would be all I do with it, I'd prefer Micodial.

> Hmm, I meant all the unix stuff actually, on the ext2 or minix

Maybe it will hurt someone's magic "Atari-feel", but on my desktop I don't even have icons for the different drives. I have one icon for drive U:. My desktop starts with an open window containing the contents of drive U:. From there I can select both my traditional drives a, b, c, ... and my unix directories like /etc /bin /usr ...

> I also never found a fix to get my pallete right with NVDI

Ah, yes, I never got that far into setting everything up.

>I never use u:/ with my MiNT setup.

But for doing the settings in mint.cnf and such, it seems to be
correct to use the u:/.

I looked at Easymint, but none of the readmes say exactly what
is in each part of Easymint. One said libs.tar is libaries, but
libaries for what? Gcc? Some newbies won't understand file
trees either. Is network.tar needed for dialup, or just fancy
stuff like webserver, I guess that installs apache? I don't
want to install something I don't need.

Check you can get all the hardware needed for this before going further, if
this uses the Genius pocket adaptor they're not easy to find it seems!

I like Magxnet because it's still being developed, transferring files is
quite straightforward using Vassilis' port of the Samba client, but in
return you will have to do some mysterious tinkering with config files
(which you will also have to do with MiNT).

Slated for the future is integrating Samba with Bnet, which will present PC
drives and printer on the Atari's desktop for true drag'n'drop integration,
but at the moment file transfer is from a ttp (not too difficult), or if
working from the PC end via an FTP client (or from your browser) with an FTP
server installed on the Atari.

STinG also works, and if you've already got this installed as your dial-up
might be worth considering. You'd have to use FTP to transfer files, so I
assume an FTP server running on each machine in the network would be needed.

Cheers

What can I say ? No other Atari OS works on a Mac that way.

I am reading those threads just to see if it will become possible to run MiNT
on a Mac or even a PC at least at the same speed and with the same features
then MagiCMac.

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

I use Taskbar to kill apps. just right click on them and choose kill.
It's pretty convenient.

>

I never use u:/ with my MiNT setup. You defintiely don't need to use
this. The icon for u:/ sits in a corner by itself. I just go through
the normal drive icons. You can directly access all the unix
directories (usr, home, etc) by choosing the drive they physically
reside on. Having the u:/ makes sence from a unix point of view, but
it's not necesarry for atari users to use.

>I also never found a fix to get my pallete right with NVDI
>intalled. I also believe you can not print with NVDI under
>mintnet.

NVDI 5.03 works like a dream on my TT with N.AES/MiNT. It prints
fine, but I don't use its screen drivers because I have to use fVDI
for that (I have a Galaxy). But the pallette is fine and I've never
had a problem printing.

Hi Mathieu,

>Could someone tell me quite precisly what is missing ? I really would like
>to finish that work and make it accomplished instead of "fastly presented".
>I also know my english isn't the best so if someone want to suggest some
>better translations for Organizer (and/or its website), please contact me !

There's quite a lot missing... too much to list here really, there's a
complete translated and slighty improved RSC file in your mailbox right now.
But unless you translate some French text strings in the binary yourself,
the users will still be faced with some French lingo... ;-)
In general it's not a good idea to put parts of the dialogs and/or strings
in the program itself. It's a pain in the **** for the translators and the
programmer has to maintain and compile different versions of the program
each time there's an update...

Cheers from Belgium
Dennis

Actually, Jinnee is quite useful in that respect. I open the
folder, type *.gif on keyboard and "delete key", hit return and
they're gone. But I know what you mean about command lines,
there are examples that I can't remember, where a CLI is more
useful. They usually come useful, as you say when you have
hundreds of files.

Hi Martin,

>FX accelerator ? Never heard of it before. What is it ?

Sometimes called Blowup FX, with the screen expander software
and stuff. It can make the bus at 20MHz, and the CPU max of
40MHz. 40MHz seems a lot for a 16MHZ chip!

Is my card in some way really unusual?

Mine has 2 banks of 6 simm slots and 1 bank of 4 simm slots, each bank currently has 2 simm in.
If I move the simms the fill up a bank the card is not recognised at all.
I have since got my HDD running and can see now the machine crashes (2 bombs) once all devices are checked, just as it says 'Booloaded'.

I just hope the card isn't duff but it doesn't seem to work if I replace the simms either.

From Taskbar, wonderful prg btw. With just a mouse click you
can kill an app. Also Connexion will give you a nice simple
Gem dialer for pppd, one click and you are online.

Still I am baffled about the u:/ drive, I never really use it for anything,
so I am not sure what you are trying to say. I never install anything to
that drive.

Hi Mike!

IIRC, Later DOS formats had E9 00 4E for the first three bytes
(earlier, DOS 2.0 had EC 2C 90 and DOS 3.3 had EB 34 90).

>I think PC formatter will format the disk thereby losing your data.

I have a very old 7kB program called DISKMOD.TOS that writes a new
PC-style boot sector from a 512-byte file BLOCK0.DAT to the disk,
but leaves all other information intact. The first 3 bytes are
$EB $34 $90 followed by 8 bytes that spell out IBM 3.2 in ASCII.

Obviously it can't be used for booting or programs that have a
branch command in the boot sector, but this is unlikely to the the
case here.

Regards, /Peter/

You have to bypass the driver on the HD.
Right when you see the nice Atari logo appear, hold down the Alt key down.
Keep the alt key down until you see the floppy led, then let go.
The floppy should take off an everything on the HD should be ignored.

It is obvious that you are the user who never tried a thing that is
complaining to.... :(Sorry, this is only my pure opinion in this.
If you would give it a try then you'll have live OS with open-source
access. This means that if anyone drops it you can develop it further.
And ASH will never publish the sources IMHO.

Keep up the faith and pay for MagiC on. ;)

Message-ID: <1020718436-767687AEicMi@adel6.freeserve.co.uk>
Source record: 35227

Hi All SCSI fans(?)

I downloaded the demo of HDDriver 8.10 from Uwe's site. I ran the HDUTIL program to install the driver to my C:, don't worry Chris - everything is recoverable again! Infact the demo takes the settings from the current version of the program so no need to remember what you had in the various parameters.

Also I discovered that I had not configured my upgraded version of Extendos (v3.40), so that the CDRW (ID 1) was P: !! This made the difference next time I booted in that the Adtron was 6.00 & 6.01 (as the rotator on the back of the unit).

>Looks as if you have configured HDDRIVER to scan the devices in another
>order than usual. Note that the ID check always scans lowest numbers
>first, regardless on how HDDRIVER was configured. So the order of
>devices can differ, but the SCSI IDs are always consistent.
In the demo (& subsequently my v8.04), I initially had checked the option for "Test two LUNs" - this shows up on booting the computer. Both LUNs were shown. I unchecked this box and magically, the Adtron appeared (on boot only) as just 6.00, doing a "Device check" reveals that both LUNs still exist (therefore no change !).

I have the following order for "Devices & Partitions":
2.0 1.1 1.2 1.6

>
>> change the ID from 5 (+ 01 LUN)! Is the unit faulty
>> or is there some other switch that would work?
>
>Does this unit actually implement two LUNs? This is unusual. It could
>either be a (minor and non-relevant) flaw of the reader's SCSI firmware
>or due to your version of HDDRUTIL/HDDRIVER (seems to be quite old) not
>scanning for LUN1 properly. Can you please check whether the current
>(demo) version reports two LUNs as well?
No idea whether the unit is supposed to report two LUNs, the instructions don't mention any details like that! I would have to check with Peak UK. The Demo does report two LUNs as well, and Chris's does so we can can take it that this is one of the "unusual" items!! I agree with what Chris Crosskey said about it because you have in effect two devices in one:
6.00 The Adtron PC Card Reader
6.01 The Card with an adaptor interfaced to the Reader
>
>> The drive works like a dream (with a Compact Flash
>> adaptor & 16Mb Card) - just like an ordinary disk,
>
>Sounds good. Actually this is what one should expect, since as long as a
>device acts like a hard disk drive it's not relevant for HDDRIVER
>whether it is a real hard disk drive or something that only claims to be

>such a drvice.
There is a bit of lag between double-clicking on a program and it loading and running in memory - this maybe due to the tardy data-transfer rate? Currently I have a selection of Gemgames on my "Cartridge" reminds me of the old 600XL! Star Raiders on Cart!?

As for Jinnee, that was a different matter!
With the CDRW being 1.00 and the PC card being 6.00, you would expect that the next available drive letter would go the CDRW!?! No. The PC Card gets P: - this means I have to alter Extendos so that it hooks the CDRW into Q: !!

I assume that because the Card Reader is present at boot time due to being recognised by HD Driver that it gets the first letter after the Hard Drive, the CDRW gets the next because an external driver (Extendos) has to be loaded before it can be recognised by the desktop?
Is there anyway of changing this? In Jinnee or Magx.inf?

Thanks

Neil :-)
3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14Mb/1Gig/CD

Hi Tim

| I finally got hold of my Atari TT, hmm not to chuffed.
|
| It has a Ge Soft Mighty Mic 64, TT Ram card installed with xxMB ram on it.
| When I boot up the machine, it counts up to 4MB of ST Ram and 16MB of TT
Ram
| then after waiting for the hard drive to spin up crashes with 2 bombs.

What happens if you remove the hard drive, will it boot to the desktop
without nukes?.

I think it is possible, since the SC1435 is just a standard RGB
monitor (usable by the Jaguar and other gaming devices). I'd try
connecting the three color lines directly to the RCA jacks
(w/grounds). Please note, I've never tried this, so I wouldn't test
it on a 36" TV! Please try this out on the cheapest video equipment
you've got! I've seen reference to 150 Ohm resistors in line, which
certainly is worth trying.

I agree with that. The Atari platform is too small to not have everyone working together. I have both OS's and use Magic the most. I am just starting to get things working under MintNet/Mint and am also just beginning to understand how things work. Most new programs coming out need MintNet/Mint, so knowing how it works is to my advantage. I will problably end using both.

You might try Systems For Tomorrow at: http://www.SystemsForTomorrow.com/.
This is where I originally got HDDriver. They may have it, but may not
have the latest version, 8.11.

Of course you could get it straight from the author in Germany at:
http://www.seimet.de/index_english.html. That is where I get my upgrades.

Another nice place is the Atari Workshop in the US at:
http://www.atari-workshop.co.uk/. I just received my upgrade to Jinnee
2.5. Took only 3-4 days.

Hello,

I assume you want just to access your hard drive if something happens
to your auto folder or any other programs on your boot partition. Try
this. Boot up the computer with the hard drive turned off. Then turn on
your hard drive and then run AHDI.PRG.

I really would get HDDriver.

Yes, most likely it has to do with the transfer rate.

> Is there anyway of changing this? In Jinnee or Magx.inf?

The assignment of driver letters is neither done by Jinnee nor by MagiC.
This is always the responsibility of the driver for this device. For
drives managed by HDDRIVER device numbers are assigned in ascending
order, unless you configure HDDRIVER differently.

on the subject of "1st word" free?.
>I'm pretty sure most UK PD Libraries stocked 1st Word, so I guess it's PD.
>I'm pretty sure LAPD did.

Yup the former LAPD did have it when i took the library over, and that
was after the Atari funny bizness (when they listed their non pd stuff,
'the neochrome affair' etc).

I've still got it listed in my pd library. It's one of those programs
that if you liked, you were more likely in buying the latest version
with all the trimmings (dictionary etc.).

> <snip>

Hi Tim,

here some information which I found in the "DoitST" from Robert
Schaffner (http://www.doitarchive.de/) - I hope Robert does not kill
me for that because the Doit hints&tips are not freeware ...

>>>> copied and translated from DoitST >>>>
RAM Expansion for Mighty Mic 64 Accelerator Board. Use the table for
RAM konfiguration and jumper setting.

Jumper setting| Memory Banks
J0/J2 | J1/J3 | Bank 0 | Bank 1 | Bank 2 | Bank 3
2-3 | 2-3 | 4MB | 4MB | 4MB | 4MB
1-2 | 2-3 | 16MB | 4MB | 4MB | 4MB
2-3 | 1-2 | 16MB | 16MB | 4MB | 4MB
1-2 | 1-2 | 16MB | 16MB | 16MB | 16MB

The board only works perfekty with SIMM modules from Toshiba and
Samsung. All modules must have a access time between 60 and 80nS. All
others maybee not work. You have to use simple page mode rams als 30
pin SIMM. To get a memory bank of 4MB you need 4* 1M*8(9), further to
got a 16MB bank 4*4M*8(9) needed.
<<<< copied and translated from DoitST <<<<

As far as I know these old 30 pin SIMMs you allways have to fill a
bank completely. So in your case it would be a good idea to get
another 8 SIMMs (1 or 4 MB) so that you can fill all banks (a bank
consits of four slots so the 2x 6 slots represent 3 banks)

Greetings Martin WW

Well, sounds not good. (But far from work, thats OK for a while) :)

> will try to put afterburner falcon back in rack case (hard with cast
> on arm). has MiNT and STiNG on harddisk, will test scsi adapter friday
> night?

Jep, something to do. One arm bandit ;)
Bad to fit some hardware. I hope scsi adapter works fine.
Waiting some reports :)

> say hi to dagmar and dahna

Done :)

>> Nothing to see, please move along.
>>
>Ok, now you just realized what MySQL offered over Phoenix, feeling
>embarassed somewhat?

Embarassed? Who? Me?....
I'm not the one claiming MySQL offers more, and I'm not the one claiming
it's available on this platform...
All I wanted was a database with or more less the same features as Phoenix
that in addition knows SQL... I never asked for what you're trying to
shove up my ****.

>You now have to throw some words like vapourware. Does that hurt that
>bad?

Uhm, but it *IS* vapourware !!!
The fact that it is on Vido's hard disk, doesn't really qualify it as
being available for download to the general public, does it? I thought
that this was one of the strong points of GNU licensed software, which
just goes to show...

>Get the src, openly available, then type ./configure
>then: make all
>There.

This is a joke right? It *must* be a joke...

So what do I do to make it GEM compatible?
type:
./lame mode
./make Atari friendly
./use Gem GUI
etc...

OK... fine, while I'm at it I'll convert Mozilla, Star office, Gimp etc
also, if anyone wants it, tell them it's on Dennis his hard disk. But they
better hurry up, chances are that it will be deleted very quickly to make
room for more interesting things, things that actually work.

Cheers from Belgium
Dennis

Message-ID: <1020794288-73591AEicMi@gmx.net>
Source record: 35104

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Sun, 5 May 2002 17:28:12 -0500

Hi Frederic,

>MagiC users, please speak aloud, I know you have been reading this 'now'
>long thread about magic/cli/gem/gui/sql.
>None of you really dipped in it. Why is that?

Ever heard of the silent majority? :-)

>Do you consider Dennis the spokesman for you, being MagiC users?

I hope they don't....
The regular posters in this newsgroup are old, wise and articulate enough
to speak for themselves, they don't need someone to speak for them, and I
don't really consider myself to be anyones spokesman. Unlike you and some
others here I never use the word "we" in my postings.

>I am just curious, because I know that there are MORE than 1 user (Dennis)
>here using MagiC.

I like to think so too.. If I'm the only MagiC user left then it's time to
put me inside a zoo (rare species). But then your logic isn't very logical,
since only a handfull MiNT users replied to this thread you better join me in
the zoo, I'll ask not to put us the same cage... <grin>
Since you are so curious, you might perhaps ask your fellow MiNT users why
they didn't reply to this thread. I can't imagine everyone being crazy about
your "vision for the future" either.
Aren't you a little curious why for example Henk Robbers spend all that time
and effort on XaAES which will be obsolete soon if you and your band have
their way ? Don't mind the people thanking him for XaAES, these are just
misleaded MiNT users who obviously haven't seen the light yet.
The future holds CLI apps and very rudimentary ported GNU apps, anyone here
who's considering buying a new mouse: *DON'T*, it's a waste of money, on
other platforms they use cordless mouses, well, on the Atari platform they
are going to get rid of the mouse all together....
Keep on dreaming...

>Yet none of you really said anything, speak up! :)

Perhaps it's because people following this thread realise that MagiC has
nothing to do with this. My replies have been pulled out of context and
turned into a MagiC vs MiNT thread. That's the beauty of quoting, one can
reply very selective to a post, and ignore the "tricky" questions, and you
truly are a master in pulling replies out of their context, in fact, you
refined it into an art form, congratulations..... what's next?

Cheers from Belgium
Dennis

Hi Jean-Luc,

>#_SLB 0 LAME_ENC.SLB <--------- Watch out! This line should *_not_*
>appear in magx.inf!! If so, the lame_enc.slb is declared used by
>another application when attempting to encode mp3s. After searching
>for a long time, I found that it was used by MagiC itself, although
>it really didn't use it :-/
>But, due to the fact that it was declared in the magx.inf, it was
>kind of reserved by magiC and so unavailable for AniPlayer :-(
>(I guess if I was understandable... :-|)

Understandable enough.... :-)
You are absolutely right. I never really tried to encode WAV or AIF into MP3's since it's so painstakingly slow (OOps, I shouldn't have said that, someone will come forward now accusing me of driving people away from this platform, and before we know it this is going to evolve in yet another long thread...), anyway, I didn't really had an idea .
Is it a bug in the SLB? none of the other SLB's behave like this... and is this only present since version 2.19 or did older versions suffer from it also?

Cheers from Belgium

That is fine. I have no problem reading German (speaking it is a different
story, but...).
The only problem is your site says (cash only). Believe it or not, I can
get my hands on
Euros, but sending it through the mail is something I would like to avoid.

I would prefer to buy from you, Uwe, since your price is ~ $32 where the
Atari Workshop
price (with the English manual) is ~ $44.

Thanks,
Chris

4060. atari mega st 4 - interested?

Would anyone be interested in buying a modified Atari Mega ST 4, with a number of switches at the back, one for Cache, one for TOS version toggle, and another one for something else...ramdisk maybe... i cant remember. Also I think it has a 1.44 meg floppy drive.

UK only please - if interested please email spacedmonkeys@yahoo.co.uk with your offer

Don't get into trouble on my account

Could there be something where once the bootstrap has been loaded the TT ram
is switched into a different mode such as burst mode or something?

I just can't see how the TT could test the memory, pass it and then crash
when it tries to use it.

Tim

We never told that CLI apps are better then GUI apps.
We just think that if app does not have GUI it does not decrease usability
of this app in our eyes.

I did trie. I didn't use LAME_ENC.SLB but bladeenc, on my MiNT sytem.
I wanted to put my 68882 FPU, that finally arrived, to the test. I took a
little piece of 1 minute 11 seconds of piano music from a CD, and encoding
to a MP3 took about 1 hour and 50 minutes on my Falcon030/CT2b with FPU.

Personally I don't care. I don't stick to the Atari Platform for it's
speed. I don't like motor racing either, I prefer to keep healthy ;-)

Since a few years we have a nice new word in the Dutch language for this:
"onthaasten". I don't know how to translate it into English. But being
from Belgium you should know what I mean :-)

Message-ID: <j_VB8.8750$KQ6.253879333@news.inreach.com>
Source record: 35114

ok, I figured I'd better check out the machine before trying to hook that pc power supply into it and the following is what I found and what happens ...

1. all 3 red wires read as 5.00 volts, the Blue wire reads as 11.35 volts (all readings in VDC)

I found my Falcon to 1224 plug and hooked up the 1224 that's on my 1040ST and works fine.

Falcon NO DISPLAY, screen is BLANK, zulch, nothing. Machine just sits there, don't know if ide is booting or not.

Removed IDE drive, same same, nothing changes Does not seem to be accessing floppy or anything.

Video fryed???

if power supply is ok, then something else went down south when IDE drive was put in.

I don't know anyone that repairs them either.

Message-ID: <3cd83542$0$29604$4c56ba96@master.news.zetnet.net>
Source record: 35116

Hi all!

For as long as I've been on the Net, I've used Newsie, currently v0.961.
What I'd like to know is what program/s do you recommend to use to replace
it?

Requirements:

a) must run under MagiC. I use v6.01.

b) must run under Stik and compatible stacks. I currently use Sting v1.26.

c) preferably freeware, but I'd accept shareware.

So what do you recommend and why you recommend them for:

a) email

b) Usenet news

c) FTP

Cheers!

James

ok you obviously just don't get it.
Should I draw you a picture?
Once again, and I HOPE for the last time:

I love GEM and the GUI and the cute little mouse and the colors, and the
nice fonts and all. HOWEVER when GEM lacks an application or the GEM

version just plain sucks, I look for alternative from another world (GNU).
If this application (GUI OR CLI) is better I would use it coz it fits my
needs, EVEN if it is not an atari native application.
Papyrus is a really good app, so I use it, WITH mouse and GUI and nice
resolution/depth under MiNT.
Is that any clearer? Would you like to me translate this message in
Walloon or Flemish for you?

PS: And this guy is doing the translation
for the technical/app docs (DDP)??
He can't even understand plain english.

Hi Dennis!

I agree with you 99.99%. The odd 0.01% is because at least one
alert has to remain in the program itself. Guess which one!

I have seen the problem in PixArt, where there are two! RSC files
but still alerts in the binary - and in addition parts of some of
these are reused in dialogs and so are position-dependent :-(
Furthermore some of the ST-Guide call strings are also used as
window titles. That may be 'efficient' programming, but as you
say a PITA for us translators!

Regards, /Peter/

>the PC's. I used this regularly.

Hi Mike!

IIRC, Later DOS formats had E9 00 4E for the first three bytes
(earlier, DOS 2.0 had EC 2C 90 and DOS 3.3 had EB 34 90).

>I think PC formatter will format the disk thereby losing your data.

I have a very old 7kB program called DISKMOD.TOS that writes a new
PC-style boot sector from a 512-byte file BLOCK0.DAT to the disk,
but leaves all other information intact. The first 3 bytes are
$EB $34 $90 followed by 8 bytes that spell out IBM 3.2 in ASCII.

Obviously it can't be used for booting or programs that have a
branch command in the boot sector, but this is unlikely to the the
case here.

Regards, /Peter/

>Yet none of you really said anything, speak up! :)

I can't be expected to read EVERY thread, that would take hours. I have a
life to live.

The subject said to me that it wasn't anything that I'm interested in. For
example why the heck would I want to use a CLI? That's going back to the
prehistoric age, before computers had GUI's. Maybe you need to use a CLI
in MiNT, but MagiC provides all the functionality I require from it's GUI,
eg Jinnee.

I'm saying that CLI's don't provide extra functionality such as parameter
passing easier, but hey, never heard of .TTP and .GTP programs?

I'm not saying that MagiC is better than MiNT, I have even thought about
trying it out. However MagiC is easier to install (painlessly) and use,
and once someone is used to something it's hard to change. This is why
there are loads more people using MagiC, they want something that's easy
to learn and use.

Cheers!

James

ON my Hades I can boot off of the floopy if I hold down the "A" button.
Maybe that would work. Also, I try holding down the ctrl-shift buttons
or the ctrl-shift-alt buttons. That may do it.

That would me nice, but the summer brings with it many storms, it rarely ever just rains, it almost always has to thunder and lightening. In the event I did leave it run (my friend had his 8-bit system toasted) I'd be out quite a bit of money if I lost the Hades060. I'm very afraid to leave it run when I'm not at home. ;-)

They copied my site back to the new server so if anyone notices a problem with it let me know.

I don't know who originally wrote this paragraph, it was not quoted
properly. Doesn't matter, whoever it was is a dam retard. There is only
one freaking CLI that most people use and that is bash. Beyond that the
rest are text based unix apps, many have tried to explain the difference.
Apparently it's pointless to try to explain the simplest thing to an
absolute moron. Some of those GNU apps do 10 time what an GEM app is
capable of, some do what no GEM app can do.

Such statements usually comes from people who have never used or atleast
learned to use scripts or even the command line itself. Lots of people
think manual gearboxes are prehistoric too, but why do almost every
sportscar have them?

Just in case you should think $44 is too expensive: Note that I do not
think that $44 is too expensive. It's only fair that Atari Workshop is
paid for translating the manual and also for doing support.
As far as payment from the states is concerned, I forgot to ask my bank
about PayPal.and whether there are any fees to be paid. I will check
this later today, please stay tuned.
As far as sending cash is concerned, there is no risk if a registered
letter is used. There have never been any problems.

OK, best to get a copy of my original post on how to set it up,
there are a couple of files to edit with text editor and set up
the programs. Most useful is o.inf, the config file for Okami.
Edit this to suit, look through and read all, takes some time
but is really worth it. O.prg is the main program btw, i would
have thought it would be called Okami.prg but thats the way it
is :)

Hmm, this is odd! It's working fine here, I doubleclicked, but
in Okami, which brought up CAB and it started the download. Can
anyone else have a go? Derryck, could you try copying and
pasting that URL in to CAB, do you have another computer to try
that on?

I've just checked the PayPal web pages again: PayPal takes a fee of
$1.50 for withdrawing money from an international acoount and it is not
possible to withdraw less than $25. Even without any fees I probably
would have to pay to my bank, the fact that it is impossible to withdraw
less than $25 means that PayPal is not useful for me. (Note that
PayPal's US withdraw regulations differ from the international ones.)

You could take a look at Okami in combination with Popwatch and Newswatch.
People who have managed to configure it properly say this is the best
solution for Mail and News.

MyMail and AMail are also worth trying. But MyMail will (hopefully)
support News only in a future version. AMail only supports News-reading. I
hope news posting will also be supported in the future. I use these
programs because I never managed to configure Okami correctly :(

For FTP I use Aftp. But I don't know if it runs with STiNG. I
use it with MiNTnet.

> Is it a bug in the SLB? none of the other SLB's behave like this... and is

It's not a bug, because the unix lame library use globals variables and
this SLB is just the shared library version of this unix library, after
the first slb_open the SLB is locked for avoid crash or bad encoding. If
you put LAME_ENC.SLB inside MAGX.INF slb_open is called but the SLB
isn't used, after when Aniplayer use the system's call slb_open, the SLB
return than is already used. If you put all SLBs inside MAGX.INF the
main problem is also the saturation of the memory for librarys not used.
I think you must put only the AES/system extensions inside MAGX.INF, for
the others SLB it's different (like PC and DLLs). The GEMDOS function
slb_open use 3 ways for find the SLB directory:
- the path send to this function (here the directory of Aniplayer).
- the env variable SLBPATH.
- under MagiC, the XTENSION folder.
So for me there are no problems for found the SLB files.

> this only present since version 2.19 or did older versions suffer from it
> also?

Yes, there are no changes inside LAME_ENC.SLB since 2001 June.

About DivX, Aniplayer 2.20 arrive (some weeks/days for translations)
with another shared library AVCODEC.SLB, now it's possible to play all

AVI/MOV divx3 and divx4 files with mp3/ac3 track (ac3 decoding is slow)
and save all movies played inside Aniplayer in AVI/MOV divx3/divx4. It's
possible to play and save AC3/MP2 sound files. AVCODEC is used by ffmpeg
on the unix world "ffmpeg - hyper fast encoding" so under a 68060
MP2/AC3 enoding is fast. For exemple under MagiCMac and my iMac G3
500MHz it's possible to convert a 3mn audio track in MP2 during 1mn30.

Regards,

Didier.

Yes, I am a total GUI buff.
I dont like the CLI way of working with computers. It gives me a very
unhappy feeling of blindness. More important is that I cannot type more than
3 characters without a typo. I am a dystypic.
If there is no GUI app for a certain function I cannot use that function.

This does not mean that I detest CLI users or want to put obstacles on
their path or call them names.
In the very early stage of my work on XaAES I ensured that TosWin2 was
running properly.

Some people have sent me screenshots of their desktop.
Many of these desktops showed a TosWin2 window in which I could see
bash running. Which gave me much satisfaction.

I like hard working. I can look at it for hours. ;-)

Sportscar ? In fact I've never seen a car or any other motor vehicle without
a manual gearbox in my life, maybe it's because I'm in Italy, BTW this may
explain why I always have at least one cli installed, even on the Mac.

I've got Score Perfect Pro 3.2 running on my Falcon030/CT2b in Turbomode now, and it really pays off ! Formatting scores is much faster and comfortable now. The trick was to find the right settings for the TT-Ram flags. Fastram flag has to be set for Prg only, NOT for Mem. Fastload flag has been set to.

Score Perfect Pro 4.0 is another story. On my Falcon it's virtually unusable. It crashes/hangs as soon as I try to load a SON file from the fileselector. Any of the very few SPP 4.0 owners having the same problem ?

Source record: 35143

Hi,
it's very important. I used my ST as a MIDI sequencer with CUBASE. Now
my Atari discdrive is broken.

So I decided to use my PC for running Cubase VST :) I am happy with
that. But I still have many Cubase-MIDI-files on Atari ST formatted
discs. The PC cannot read them.

Is there a possibility to convert the discs for PC?

Thanks a lot...its very urgent.
Greetings
Matthias

Hi Martin!

What else do you have running n the Falcon? As I think I've said
before, I found with SPP 4.0 I had to disable COPS and LEDPANEL
for it to run. With them either the menu or the note input didn't
work and the computer froze. Without them it ran OK.

I have just tried loading a .SON from 2.0, which converted perfectly.
I then saved it in 4.0 format and reloaded it without problems.

So I suggest you try SPP 4.0 on a naked machine and see what happens.

Regards, /Peter/

Problem already solved. I simply re-installed the whole package, set the
TT-Ram flags the way I did with 3.2, and now everything works fine. Must
have been some missing or corrupted file somewhere.

Yes it is possible. Some people have given me some info in a very recent
thread with the subject line
"Q: format existing diskette to be I..."

To modify the existing disk you need to edit a few bytes in the boot
sector. I have not had a chance to try anything yet, so I cannot say
more.

And probably Andreas Kromke think it's usefull too as there is one in
the MagiC package (MCMD.TOS). I use it from time to time.

Bye,
/Pascal/

On Tue, 7 May 2002 at 13:42:08 a message from Ralph E. Dodd was created
on the subject of "1st word" free? magazine question.
>Hello,
>
>I have need for a copy of First Word Plus. I have a lot of STart magazine
>disks. Is this the mag that had First Word Plus? If so, does someone know
>what year and month it was? The labels don't list what progs are the disks.
>Thanks a lot.
>
>Ralph

The magazine is ST Review and it is on a disk of it's own with the name
on it.

I dont know what issue is was off-hand. The magazine also had a spell
where they didnt even put on the disks which issue is was from.

Loading SON files with SPP 3.1 and SPP 4.0 on my CLAB Falcon and on my standard Falcon always goes well. The software is as stable as can be. But as soon as I switch on the FX accelerator (on the standard Falcon) both versions of SPP crash constantly. SPP doesn't seem to like accelerators.

Cheers
Dan

Yes, that is possible, but tricky to do. Too bad you do not know
someone with an Atari ST. Then you could have him/her copy the contents
to their hard drive, reformat the disk with a PC boot sector and then
copy them back onto the disk.

Another way would be to send the disks to a Atari users and have
him/her email the contents back to you.

You could try usng one of the many ST emulators and see if the disks
can be read.

We've all heard the line about giving sinplop the troll the pushoff. I'm also thinking its a good idea. After all, it's been years that he's been around and still hasen't done anything useful for anyone. We all know he's a liar and second rate loon. Personally I'm tired of sporking him when all he does is come back with the same blatant lies over and over. I'm not even gonna bother mentioning them all, it would take too long. So lets just post him on that internet kook of the month site and have done.

> sportscar have them?

That's a truism as far as I'm concerned. I used to be anti-CLI until I started working with Linux seriously. There are a number of times I open a CLI window just because it's faster, much in the way that keyboard shortcuts are faster.

For example, I recently had about 50 GIFs in a temporary folder that also contained about 40 other files. To delete these GIFs via the desktop I would have had to have changed my sort to "Sort by Type", scrolled to the first GIF, clicked on it, scrolled to the last GIF, shift-clicked on it, and dragged the mass to the trash can. Instead I clicked on my CLI window (which I always leave open), typed "rm /temp/*.gif" and happily got back to work.

For those of you who dislike CLI, think about keyboard shortcuts. At first, you (and I) prefer using the mouse to select "Save" and "Copy", but after a while <Control-s> and <Control-c> become second nature because they are easier ... once you get used to them.

For Immediate Release to all Internet and related groups!

The Classic Computer And Gaming(CCAG) Show 2002 is on!

The Classic Computer And Gaming Show 2002 will be held
on May 25th, 2002 from 8AM till 2 PM. Vendor setup is on
the 24th from 5:30PM till 9PM, and from 6:30AM till 8AM on the
25th. Show location is at the St. John Lutheran Church,
11333 Granger Road, Garfield Hts. Ohio, 44125.

Here is our own site for more information and current status
of vendors and attendees.

www.ccagshow.com

Table rental is $5 this year, and admission is only $2.
The admission fee will also allow you to be eligeble for a
drawing at 1PM, the 25th, for an Arcade machine! (You will
need a way to take the machine home with you!)

The web site, www.ccagshow.com, has site info, table layouts,
map info, etc.

For you Atari fans, we have Nicholas Harlow of 16/32 Systems
showing up! And for the Astrocade fans, we have Adam Trionfo
of the Bally Alley site making his appearance! Lots of fun
for everyone!

We hope to see you there at the CCAG 2002!

Actually, this isn't bad provided the front end allows for converting
a whole folder at a time. I would gladly let my Falcon convert away
from 10PM to 6PM while I am sleeping or at work!

I haven't actually attempted any encoding yet. Does the front end
allow for converting entire folders?

Starlord,

Lots of things can happen that will "kill" a Falcon. Fortunately,
most are repairable. Try to think through everything you did and post
it here.

I thought recently that I had killed my Falcon. After much testing
and prodding I noticed that I had put the RAM board on one pin out of
line! Seating it correctly solved my problems and the Falcon went
from dead to alive.

As for power supplies, the pin closest to the keyboard is +12V. Note
that on many PC supplies, blue is -12V and yellow is +12V. Get the
right one! The red are +5V and the black are grounds (returns).
Using two Compaq Deskpro connectors (at least I think they were for a
Deskpro -- anyhow, they fit the Falcon board perfectly, though there
are two unused pins), a power supply 12" extension cord and some extra
red and black wire I made a rather nice adapter cable from a ATX power
supply to the Falcon motherboard. Post if you want me to add detail
on how to do it.

Please note that many PC supplies use blue for -12V. This is not what
you want! Make sure you connect a +12V line there (it's often
yellow).

I agree. This does seem fair. Though, I can make due with the German docs
just fine, especially if it saves me a few dollars.

> I've just checked the PayPal web pages again: PayPal takes a fee of
> $1.50 for withdrawing money from an international acoount and it is not

Hmmm, so $1.50 + $32 + (your bank fees) >= $33.50. So, the
question is how much are your bank fees and are you willing to
accept PayPal payments? If not, I guess paying $10 for an
English manual will not break me. Just thought I would ask.

Thanks,
Chris

4121. Jaguar to SC1435

I've got a K-Type Jaguar (American) and a SC1435 monitor which I've only ever used with my 1040STe. Everything works fine connected to the parts they should be connected to.

I just purchased a Jag to SC1435 cable from B&C. I hooked it up, and all I get is the annoying screen-flipping nonsense you get when the devices are out of sync. There is no way to adjust the monitor (via external controls) to fix this.

Question: I didn't think this would be a problem? I thought the Jag and SC1435 used the same sync? Does anyone know the fix for this (other than some soldering hack, which I won't do.)

Arrrggghhhh... I was all ready to enjoy my Jaguar games in crystal clear mode!

I was think with all the people purchasing systems with memory upgrades or buying used memory upgrades without manuals it may be a good idea if someone starts collecting these manuals. I would be willing to collect the manuals and post them in a format that would be easy for everyone to view. So if anyone has a manual for a memory upgrade you can send it to me or you can scan it and send it to me and then I will post them and maintain a site for this information.

If theres a site that Im missing that alread does this can someone please let me know.

Don

Why don't you just send the money in cash in a registered letter? This is something that has worked well for years and is not expensive. And it will not take very long because as soon as I have received the money I will send you HDDRIVER by e-mail, so that you don't have to wait for the software longer as required. The manual I will send by regular mail, of course.

FX accelerator ? Never heard of it before. What is it ?

Both SPP 3.2 and 4.0 work well now on my accelerated Falcon030/CT2b with
NVDI. Doesn't run under MiNT I think. Does it run under MagiC with real
multitasking, or just in the Single mode (which MiNT doesn't have) ?

Frontend ? I run bladeenc under MiNT from the bash commandline. Converting entire folders shouldn't be a problem. I think it supports wildcards. Even converting files lying around in different folders is possible, when I'd write a little shell script for that purpose.

IIRC the SC1435 is a fairly standard colour monitor and therefore
probably similar to the Phillips 8833 I use for my ST with connection
to the monitor via a SCART socket and that what you have purchsed is
the standard Jaguar to Scart cable.
If this is correct then you are probably having the same problem that
I had (video not syncing), this is due to the fact that the standard
Jag to SCART cable is wired up for Audio and Composite Video only and
not to the full scart specification (sepperate connections for RGB,
L/R Audio and H/V sync), also my monitors Composite video input also
doubles as something else IIRC it is one of the Sync inputs and can be
used as one or the other but not both so check your monitors manual.

My solution? - I explained the problem to the company I purchsed it
from (Telegames UK) and stated that the cable need to be wired to the
full SCART specification and they re-wired it to my monitors pin
connections free of charge, which I though was very good customer
service.
From what I have heard B&C's customer service is also quite good and
so if you mention your problem to them they might (should) offer you

the same service.

Although being e-mail or downloading free copies of software is cheap
you could try supporting the few remaining Atari stockist/second hand
dealers by purchasing from them instead!.

Greetings,

I finally got Emagic Sounddiver. Now I'm trying to run it with Logic under Magic. Michael Haydn (Sounddiver's author) says it should work...

So, I run Logic 2.5, then run Sounddiver 2 - and get a 68000 exception - Error 69. Anyone know what this means?

I'm running a lean installation on a TT with 4meg ST-Ram, 64meg TT-Ram, Nvdi5, and Magic6.

Any hints or tips would be greatly appreciated.

Thanks!

I look for the following stuff and info for the Falcon:
I have a basic Falcon 030 4 mb ram and no internal hard drive.

How can I move the Falcon over to a tower? where do I get the parts etc?

Im also looking for "Cubase Audio Falcon" , anyone selling?

how to upgrade to 14mb ram.. (where do I get the parts) and is it possible to get even more than 14?

What is MagiC all about... and who make it?

Where is Papyrus located on the web, and did they ever make Norwegian spell checker?

If anyone have audio hardware addons for the falcon.. like adat.. spdif, or jam 8 pro etc..for sale.. contact me asap.

How to speed up the machine.. Afterburner..who made it , and are they still selling?

Was there ever made something called Barracuda to speed up the atari falcon?

I have a nice audio studio already, but I want to make a record antirely on the Falcon..
And Im getting tired of surfing the web for hours without finding any answers..

If you have any info please respond.

Steve,

Thanks for the info. I have 50 or 60 disks from various ST mags (eBay) and
going through them would have taken a long time. None of them is ST Review
though. I found a link for 1st Word Plus and a lot of other useful
programs.

>If you would give it a try then you'll have live OS with open-source
>access. This means that if anyone drops it you can develop it further.

SingleTOS hasn't seen any developent for nearly 10 years now and it's still being used by a lot of people running the latest software on it. It doesn't mean because development stops, that the OS or the apps stop running. Not everyone is obssessed by the OS, far more important are the apps that run on it, even if the development on MagiC is dropped then that doesn't mean that it will become unusable the next day....
ATM both MagiC and freeMiNT already stress the potential of most of the Atari computers, develop and add more bells and whistles to it and it will become unusable for most of the users. Even today there are already people which prefer not to use the OS's because of memory restrictions.

>And ASH will never publish the sources IMHO.

Ofcourse not, they still sell it and development continues... but why would anyone want the source? I've been told repeatedly here that it sucks, the same goes for CAB, that's another app which seems to suck according to a couple of people here... weird reasoning :-/

>Keep up the faith and pay for MagiC on. ;)

This is misleading propaganda...
N.AES costs nearly as much as MagiC and even if you use the free XaAES then you still need Thing or Jinnee which both cost money. Face it, ATM there's no such thing as a complety free OS on this platform except for SingleTOS which came with your computer, but then some people will argue that SingleTOS isn't really free either...

Cheers from Belgium

Hi Raoul,

>Has anybody ever tried to translate Phoenix database
>from ASH? I think not but I am not sure anymore...(If
>it would have been it sure was a h*** of a job...)

I've started work on the manager a while ago, but since the complete dialog
and text strings are embedded in the program itself, this is indeed a hell
of a job :-(
At the moment there's roughly 40% of the code translated, but it will take
at least a couple of more months before this baby is ready to be released
to the general public... once that the manager is finished, I'll tackle the
designer and the online help files also, but don't hold your breath...

Cheers from Belgium

Hi Martin,

>> You are absolutely right. I never really tried to encode WAV or AIF into
>> MP3's since it's so painstakingly slow (OOps, I shouldn't have said
>>that,
>
>I did trie. I didn't use LAME_ENC.SLB but bladeenc, on my MiNT sytem.
>I wanted to put my 68882 FPU, that finally arrived, to the test. I took a
>little piece of 1 minute 11 seconds of piano music from a CD, and encoding
>to a MP3 took about 1 hour and 50 minutes on my Falcon030/CT2b with FPU.

In the example you've used a rather short 76 seconds song which needed 6600
secs to encode, that's a ratio of 1:87. But on a 68030/33 Mhz TT with FPU,
encoding that same song will take roughly 3 hours that's a ratio of 1:140.
Meaning if I would want to convert a typical average 3' song then I would
have to be patient for nearly 8 hours, and encoding an audio cd will need
at least 100 hours, that's more then 4 days...

>Personally I don't care. I don't stick to the Atari Platform for it's
>speed. I don't like motor racing either, I prefer to keep healthy ;-)

I don't care that much about speed either but then there are certain limits
to a man's patience, when it comes down to MP3 encoding on a Atari we're
faced with certain hardware limits which even a 68060 expansion wont solve.
BTW: Unlike you I like motor racing and I'm (still) healthy :-)

>Since a few years we have a nice new word in the Dutch language for this:
>"onthaasten". I don't know how to translate it into English. But being
>from Belgium you should know what I mean :-)

Yes I know the expression, AFAIK there's no English equivalent for it, but
it's a label which doesn't fit me... I like to feel the adrenaline pumping
and stress is something which affects anyone except me :-)
To me "quality time" equals Atari time...

>capable of, some do what no GEM app can do.

Yes we know that these apps can do what no GEM app can do... like not
being capable of running under SingleTOS and MagiC. Some don't even run
under freeMinT because the user has "only" a standard Atari. So yes it's
pointless.... how do you explain to a moron how a GNU app that doesn't
run on his OS and/or computer is better ;-)

> given the ulr for an article on doing it, but it's gone now, does anyone know
> the color code for the falcon power supply? Which lines are which amounts of
> volts?

I assume you are soldering your normal Falcon PSU connector to the PC PSU's wiring, as I did. All the colors are the same voltage and polarity except that the blue wire on the Falcon side should be connected to the yellow wire on the PC side. If you connect the blue wire to the PC's blue wire, the voltages are the same, but the polarities are switched. I made this mistake and blew out a transistor in my Falcon's audio system. It wasn't difficult to replace, but was an embarrassing and frightening mistake. I turned on the machine before casing it back up, I saw a small explosion, and half of the transistor hit the wall on the opposite side of the room with quite a bit of force. Anyway, connect blue to yellow, and everything will be ok...

Actually I have a 1.8 ghz pentium 1 gig rambus--> Cubase 5.1 in my studio
at the moment..
so I dont really need to get the falcon up and running .. But.. I want to do
a record on the falcon anyway.
just for the fun of it.. and it must be my very own falcon 030, anything
else would just be wrong for this project.
I have used this Falcon since it was released.. but never for Cubase audio..
only midi sequencing.
If it really can handle 8 tracks.. I only need the Cubase Audio Falcon
soft.. and perhaps spdif.. + 14mb , and possibly another hard drive.

thanx for your reply :)

Hi there, I would REALLY like to get "ART for Kids" for the Falcon.
I have tried to find for purchase, but no luck.
If any one has it could they get in touch with me?
I am also looking for the Softgee programs, such as Expand, Pretty,
Audio to Mid, etc. Does any one know where these can be found?
Thanks, Mark Friedman

Thing works like this too, and I use it a lot. However, it's often faster
and more efficient to just use a shell when copying/moving/deleting files
as long as I know where they are and where they're going. Moving the mouse
around, opening, moving and scrolling directory windows can be quite slow
and tedious when the alternative is a shell with auto-completion.

> they're gone. But I know what you mean about command lines,
> there are examples that I can't remember, where a CLI is more
> useful. They usually come useful, as you say when you have
> hundreds of files.

Indeed. E.g. this morning I had to search through about 200 compressed
textfiles for a lost password. It took me about 15 seconds:

```
cat lest-post.*gz|gunzip|grep passord
```

("passord" means "password" in Norwegian)

I don't have any tool with a GUI that could have done this just as simple
and efficient. OTOH I usually prefer PureC and it's efficient GUI instead
of gcc/make. So it goes both ways.

Yes, I remember that shell. It's pretty basic though, lacking some of the
things that makes e.g. bash a fast and efficient tool for the skilled
user.

I don't think tht FreeMiNT becomed slower during the years of developement.
His memory requirements are bigger, yes, but lots of it is for I/O caches to
actually spedup the system.

> Ofcourse not, they still sell it and development continues... but why would
> anyone want the source? I've been told repeatedly here that it sucks, the
> same goes for CAB, that's another app which seems to suck according to a
> couple of people here... weird reasoning :-/

CAB defienietly does not suck. At this point I agree with you Dennis.

But let me explain why relasing sources ALWAYS helps. Lets take FreeMiNT
sources. They are not well documented, but even as lousy programmer as I can
understand it. FreeMiNT was lacking support for my beloved polish
characters, so I polish characters in filenames of files created on PC's
were unredable (FreeMiNT putted '?' there). Along with help of few friends
(Frank Naumann and Konrad Kokoszkiewicz) i mandged to create code to support
polish national characters. This code is even better than only adding
support for polish characters, but any characters from any freaky ;)
language/alphabet may be recognized :)

On the other hand MagiC does not allows to use polish characers, and I doubt
it will, maybe if developers will add solution similar to FreeMiNT's then it
will.

The facts: kernel grow bigger about 0.5KB (estimated), kernel grow slower: 0%.

You can use FreeMiNT with AES 4.0 or 4.1 from Atari. It includes desktop.

> which came with your computer, but then some people will argue that
> SingleTOS isn't really free either...

Hehe, I was just about to point this out ;-) Ofcourse TOS isn't free, you
paid for it when you bought the computer.

Another thing is that "free" doesn't necessary just means "free of
charge". E.g. MiNT would have died back in 1992 if Eric Smith hadn't
released the sources to the public under the GPL license. The same applies
to XaAES.

Er... really don't see how... might the sentence I wrote mean
something else ?
Actually, I meant : ï¿½modifying a faceplate from a xyz drive so as it
perfectly fits the ST case musn't be easyï¿½.
I have both in front of me, and I really can't see how to do this.
And I didn't intend to criticize you, as we aren't there to bash at
one another, but to help each other, aren't we ?

>I only meant that I personally wouldn't want to ruin the case and make
>it look "home made". Only my opinion of course.
That I perfectly share. But, on the other hand, I modified a friend's
TT's case to make a Sony drive fit in. I don't know how long it takes
for modifying a falate, but I personally spent 45 mn to achieve it.
But, the great satisfaction is that someone who hasn't been accustomed
to atari cases can't guess it was made :-)

hmm
gif not supported by gimp?
image formats are used via the form of plugins.
Gimp version on unix comes WITH GIF support (with transparency and all).
And gimp on Windows, you need to download an extra GIF plugin (they don't
want to bundle it with it because of Unisys licence thing on GIF format).

2) you should change "Can't handle these format" to "does not handle these
formats", as in it totally can. Just 1 extra step to install the plugin.

As far as IMG. Could you tell me why it would be any good to support IMG?
Even on a 100% TOS world. Why would you choose IMG? can't support JPG? or
gif, or tga? tiff? or PNG?
Those offer advantages over IMG format.
Please explain yourself as why you would like to work/store your images in
IMG?

I'm only replying to this bit at the moment since its what gets my attention. It's also something I agree with. Manhy of the remaining atari users taht are local to me do use regular tos including myself. And I should note that very few of them venture in here to participate in this debate. Lately I've had neodesk running on my TT that I got last year and it works fine with most things except for freemint. One thing that gave me hiccups with freemint is I couldn't figure out how to get it working with neodesk. But then I only really needed it for large partitions for recording cd's. Instead I had to use bigdos to get things going.

I'm not against freemint or the other variations of mint, I even have the old Command! CLI that I occasionally use. but thats only occasional use and mostly for handling file operations like changing a group of files from read-only to read-write for example. not something I do a lot of. Cli's do come in handy on occasion but primarily I'm a gui user. In fact a number of the programs I use are older programs that I got used from other atari users. There is a very good reason for this, those programs suit my needs perfectly. So do I bash newer programs that I dont need? not on your life. Heck I wont even take potshots at mint just cause I had a problem with it running on my TT but then I dont have to use it either since I found other software to meet my needs.

As for this argument about porting open source applications and keeping them "original" or creating a gem-like shell to be able to use them in a gui environment. Take a look at whats going on with the large part of the linux community is doing. Those people are strong advocates of open source

software, but they're certainly not part of the gui vs. cli debate. Fact is nearly all of the devlepments in the linux arena in the past while have been Gui applications. I really don't think we should even be having this argument really. We've cli tools for the very few tasks that need that, and we've got several choices for our other needs on our atari computers. In the end the choice of what software / OS we use should be made by ourselves, not by others. After all if any of us for a second believed that there should only be one OS that we all "must use" we'd be in the same boat as windows users.

Thanks for all your answers...

Where can I get an ATARI emulator for PC? I think I first try it that way. I am sorry, that noone can explain how to change the boot sector of the disc. I think that would be the best solution...

I wonder if there isnt any tool for that. Normally there is a tool for everything :) Where can I find such stuff?

Greetings
matthias

4159. Converting "Notator/Logic" MIDI files to Digital Performer

Newsgroup: comp.sys.atari.st
Date: 2002-05-10 00:16:22 UTC
From: bradstanfield@yahoo.com
Message-ID: <39ede7ac.0205091616.ae5d056@posting.google.com>
Source record: 35001

H E L P ! ! ! - I have several songs sequenced Notator/Logic MIDI files that I need to convert to Digital Performer so I can continue sequencing and assigning sounds in order to finish a project that was started by another composer originally on Notator/Logic.

I have DP 2.2 on my Mac, but do not have the Notator/Logic application necessary to open and covert the original Notator MIDI files to be able to continue work on them.

SO --- Does anyone out there have a Notator/Logic application that I can borrow/rent/buy cheap or that you can e-mail to me (I have DSL and FTP) so I can open the Notator MIDI files I have on my Mac hard drive and convert/import into Digital Performer?

-OR- If you're in the L.A. area I can bring the floppies of the Notator MIDI files to you and convert them to DP there or whatever makes sense?

Please advise ASAP. Thank you very much!
-Brad Stanfield (818-752-2212)

Yes, they are available at www.atariage.com

Here's the link for the pictures:

http://www.atariage.com/images/misc/dg/

There's also been a price drop from $49.95 to $29.95.

And the Demolition Man - lost Jaguar video CD (as I like to refer to it) is going to be $14.95. Also contains 5 short clips from work on the Jaguar game Commander Blood (very short video clips with no audio). This Demo Man CD was work I did at piecing together still-frame RGB pictures in RAW RGB format and RAW audio recordings. I was able to piece all the files together and match the audio up and make Quicktime videos and then convert them in Jaguar Cinepak movie format. No game code has been found yet, but I thought a video CD would at least give people a feel for what the game may have been like.

People think that this Jaguar video CD was done by Jaguar developers. It's actually the work of me of putting all the raw footage and audio together into a format that could be viewed. And putting it onto a Jaguar CD so people could enjoy it on the system it was being developed for.

Later,

It's not that hard to read the disks with Gemulator Explorer
(http://www.emulators.com/explorer.htm). You could then copy them to
the hard drive of your PC.

4164. CCAG 2002

Newsgroup: comp.sys.atari.st
Date: 2002-05-10 02:07:22 UTC
From: James Krych <jwkrych@adelphia.net>
Message-ID: <uXFC8.2969$Ok3.1936482@news1.news.adelphia.net>
Source record: 35006

For Immediate Release to all Internet and related groups!

The Classic Computer And Gaming(CCAG) Show 2002 is on!

The Classic Computer And Gaming Show 2002 will be held
on May 25th, 2002 from 8AM till 2 PM. Vendor setup is on
the 24th from 5:30PM till 9PM, and from 6:30AM till 8AM on the
25th. Show location is at the St. John Lutheran Church,
11333 Granger Road, Garfield Hts. Ohio, 44125.

Here is our own site for more information and current status
of vendors and attendees.

www.ccagshow.com

Table rental is $5 this year, and admission is only $2.
The admission fee will also allow you to be eligeble for a
drawing at 1PM, the 25th, for an Arcade machine! (You will
need a way to take the machine home with you!)
We have it confirmed that the arcade machine will indeed be Klax!!!
You can also purchase more tickets to better your chances!

The web site, www.ccagshow.com, has site info, table layouts,
map info, etc.

For you Atari fans, we have Nicholas Harlow of 16/32 Systems
showing up! And for the Astrocade fans, we have Adam Trionfo
of the Bally Alley site making his appearance! Lots of fun
for everyone!

Okay! We are having a CCAG release. The older one was pulled.
Please check out the site for more info:
www.geocities.com/gameagain_2000/ccag.html

We hope to see you there at the CCAG 2002!

Remember that this is the Atari market we are talking about ;-). Waiting
for several people would take months. There are hardly any people buying
something.

I still use IMG format very often. Lots of older Atari software can
import and/or export only this format. For example: Wordplus, Score
Perfect Pro. Also the background of my THiNG desktop is an IMG picture.

And why can't some Atari programmer add IMG support to Gimp, and other
Linux image processing software like ImageMagick and XView ? That's what
Open Source is meant for. If you don't like it, change it. IMO that's the
essence of "Free" software: the sources are freely available. That you
don't have to pay for it is just a bonus. If you read the GNU Public
Licence carefully you'll find that too.

Martin Tarenskeen.

From: Oracle <No.Return@go.away>
Message-ID: <ISMC8.7344$b5.25026@newsfeeds.bigpond.com>
Source record: 35013

I've aquired a new unsold stock SLM605 for $5

Unfortunatly, im missing the paper tray and the controller. but it has a brand new drumkit, developer and even toner cartridge.

Also in my collection is an SLM805. can i use the controller off this or should i just purchase one second hand ?

In answer to my own question, Yes, You can use the SLMC 804 to connect the SLM 605 to the atari computer. I tried it out and it works perfectly. although, using your hands as a paper tray is tricky. i will have to find a paper tray off the equivilent Epson laser printer..

>
>Is there a possibility to convert the discs for PC?

I don't know of a PC program that does this and since it won't
read it you can't use a hex editor to change the first three bytes
either :-(. On the Atari there is a small program to write a new
PC-style boot sector to double-sided disks (only!) without
touching the data on the disk.

I think your best bet is to buy and fit a replacement drive to the
Atari - it's easy and quite cheap to use some PC drives. Or find
someone with an Atari: I could then mail you the very small
program for converting the disks to PC-readable on it.

Regards, /Peter/

Yes, but since the PC won't read the disk, I don't think either of
you can access it with a hex editor :-(As I wrote to Matthias,
he'll need to find someone with an Atari, or fit a replacement
drive to his.

You can find a hypertext explaining the TOS error code on the Belgian
ftp-server:
ftp://chapelie.rma.ac.be/atari/docs/hypertext/toserror.hyp.

Anyway that what that HYP says about TOS Error #35:

TOS Error #35

TOS Error #35, probably the most common error alert that is not self
explanatory, happens when a program you are trying to run has somehow
been corrupted. What it means is that TOS can not find some magic
numbers it expects to find either at the beginning or at the end of
the program file. This error is usually attributable to operator error
(as in trying to execute an archive or text file as a program), or to
bit rot.

HTH,
Martin

>>You don't necessarily have to cut the ST's casing if you decide to
>>replace it with a drive that can take the existing Atari faceplate

Btw. if one IS going to cut through the ST's casing to fit a generic
floppy drive, it helps to have a template for making a rectangular
hole that will exactly fit around the drive's faceplate. Several
yers ago, when I changed the drive nu my Mega to a HD one, I found
that one can assemble four pieces from an old Meccano set to get
a rectangle with an opening of EXACTLY the right dimensions. If this
is clamped in appropriate position onto the ST case before one starts
cutting and filing, there is a very small chance that one can go wrong,
and a nice hole with ideally straight edges is obtained.

(I think that "Meccano" is the generic name, those are kid's "construction"
sets of metal rods and plates with holes at 1/2 inch raster; I stole some
items form my son's noname set).

Moin Allerseits

In der g++ FAQ habe ich gelesen, daï¿œ es den gcc auch fï¿œr den Atari geben soll. Dieser soll unter ftp://atari.archive.umich.edu/atari/Gnustuff/Tos gefunden werden kï¿œnnen. Ich habs versucht, und bin gescheitert. Hat jemand hier eine URL fï¿œr mich, damit ich den gcc runterladen kann?

Die Nachrichten bitte an hahnjoerg@web.de, da ich die Gruppe nicht lese.
Ich danke fï¿œr brauchbare Hinweise.

und dann

> although, using your hands as a paper tray is tricky. i will have to find a
> paper tray off the equivilent Epson laser printer..

thats the setup similar to mine, the 804 controller but the 605 laser printer. Except mine came with old mostly worn out drum that I need to replace. My problem is I haven't found an equivalent non-atari brand drum that will work with that printer. I've asked around and had 14 different, and contradictory, answers from different people I've talked to.

Yes it can work as accessory or program and gives you a cli in a window. I'm not sure what the legal status of it is. I got my copy of it at a user group flea market here in toronto back in 1992 or 93 I think. The programs authour (he ran Intrinsic software here in toronto) was abandoning the ST to go over to the OS/2 market (huge mistake on his part, but thats another story). I also got his Laser C stuff as well which I use regularly. Thats more than I can say for command!, for a CLI its pretty good but in reality I don't use it very often. in the near decade that I've had it, I've never needed it (or any cli) more than half a dozen times, on my ST. It would only be of use to someone using some ancient TTP software like that old metacomco pascal package thats been sitting in my garage for years.

| Remember that this is the Atari market we are talking about ;-). Waiting
| for several people would take months. There are hardly any people buying
| something.

I remember this system of waiting for multiple users being used for Jemail,
Semper and LED, they died long ago.

replace. My problem is I haven't found an equivalent non-atari brand drum
that : will work with that printer. I've asked around and had 14
different, and : contradictory, answers from different people I've talked
to.

Well, then, have another. It may not be the drum. For an SLM804 with a
pretty large drum, by way of suggestion from the one Atari user (maybe)
left in Australia, I learned that my problem was a yellowed wiper blade.

To confirm this, I pulled out the wiper blade, and rubbed its end against
a flat file, and put it back in. Success! But not for long.

I got a newer one with a support made of metal, borrowed a vise, used a
large hammer to beat the wiper blade part to a 90 degree angle, then used
two pairs of pliers to bend it back up by exactly 15 degrees. Then I used
a dremel tool to cut away everything that did not fit, and drilled holes
too mount what was left. The tricky part to know before you start is that
the mounting point needs to be a half inch, almost exactly, horizontally,
from the wiping edge. Once I got that right, with large slotted holes, my
printer is happy once again.

So try that file trick first. Then, one of those people must surely
remember the model number of mechanism that is in that thing. I suspect
Canon 1000. Or, an office supply store that can find you a toner
cartridge that matches probably has a list of old printers it fits, and
your mech will be on it.

This is free advice to try something that does not cost anything,so
you do get what you pay for.

Theres no problem getting a drum and toner for the SLM 605, infact, i can
get all new parts to even repair the machine from my epson wholesaler.

Ring up a toner supplyer, and say you have an Epson EPL 6000, its the same
thing, ask for what ever you need.

By the way if you can get hold of a used Epson EPL 6000 (slm605) drum kit, you can take out the wiper blade and peel off the rubber and glue it in place of the original rubber on the SLM 804 wiper blade. they are both TEC engines, but the bastards moved the screw holes 1cm apart between each model and i think the rubber is a bit longer, apart from that they are very similar.

PS. if there was any demand for these SLM 804 drum kits in australia i could fabricate them to better than OEM spec with new parts. but no one seems to be left in australia..

That sounds like it might work but not for long. Its possible from the
excessive toner on the page it could be the wiper. But I'm looking for
something thats a proper match for the SLM605, not something that needs to be
beaten into shape with a hammer, after which it may or may not work.

4202. Any one want a SCSI ethernet adaptor?

Newsgroup: comp.sys.atari.st
Date: 2002-05-11 05:41:14 UTC
From: Iggy Drougge <optimus@canit.se>
Message-ID: <488.896T700T4014757optimus@canit.se>
Source record: 34946

I have two Dayna SCSI/Link adaptors, the BNC kind. They are untested with Anodyne's drivers (I don't have any SCSI Atari), but neither I nor the author of the drivers see any reason why it wouldn't work, since the only thing that should separate it from the "T" version is the BNC connector as opposed to the RJ45 connector of the model T.
If anyone in Sweden/Scandinavia wants one, mail me and we'll work out how to get it to you. You need only pay postage.

>Sorry, the new server is case sensitive, as it runs from Unix I
>think. Anyway, it's fixed, this works
>http://hardware.atari.org/setup.zip

Um, that's odd as I double-clicked the URL you listed in Emailer, which passed it to CAB, which then produced a "404 - Not Found". It still brings up that error, whether I use upper- or lower- case.

Cheers

Derryck

4206. Steinberg Timelock

Newsgroup: comp.sys.atari.st
Date: 2002-05-11 17:42:53 UTC
From: "news.home.nl" <FMunniksma@home.nl>
Message-ID: <iNcD8.219974$oI.14998127@zwoll1.home.nl>
Source record: 34952

Hi all,

i just got a vintage 1987 Steinberg Timelock synchronizer for Atari in the mail and of course tried to hook it up. I use it with a Falcon and CAF 206 in combination with a Tascam 488 8 track on cassette. The Tascam has sync in/out connections i hooked up to the SMPTE in/out of the Timelock. The Timelock i plugged into the printer port of the Falcon and the cable from the Timelock i plugged into the joystick port.
After some experimenting i got it to work. CAF recognized the hardware (thank god i already had an MROS driver) and generated the SMPTE code via the SMPTE out of the Timelock. I recorded 5 minutes of SMPTE code on track 8 of the Tascam, which is the sync track. No DBX of course. I set the CAF sync dialog : SMPTE sync- Timelock. Tempo sync- internal. Sync button on. It worked! I could even fast forward the tape and CAF would pick it up from there.
I decided it was time for an experiment. I recorded the stereo audio mix of the module (Roland JV 1080) on track 1 and 2 while CAF was syncing to the SMPTE on track 8. When playing back and comparing the timing of the recorded tracks to the "realtime" playback of CAF, there was a slight timing difference which got worse further on up the song. After a pause or a fast forward or a rewind there was a big timing difference like a delay effect.
Does anyone remember how this stuff worked back in the late 80ies?

Thanks,

Freek.

Unfortunately, the 6.2 upgrade is only for version 6.1. Even version 6.01
users have to pay (about $50 US) for any upgrades. I'm not sure what 2.0
users would have to pay.

I must be losing my mind, but I can't find this in my Cubase Audio Manual, and while it's not extremely important, it's bugging me just the same.
;-|

In the Hardware Setup Dialog box, under A/D Input and next to the L/R clip indicators, there is a "SYNC" checkbox. What does this function do/control? And, is it only used when recording through the Falcon's input? (I only record through the FDI).

Thanks,

-Paul

Does anyone remember what was changed between version 2.03 and version 2.06 (the final release) of Cubase Audio Falcon?

I was testing both versions yesterday for stability in audio recording, and I was having more success with version 2.03. I just wondered what I might be missing by using that older version.

Thanks,

-Paul

I cannot use DSP for latest video codecs (Cinepak was fast with the DSP)
because lastest codecs like divx need memory, MP3 is a maximum for the
DSP. And rewrite divx in assembler 68K isn't a good solution, there are
a new version after 3 months (I need 2 years for obtain maybe 20 or 50%
faster), so I use unix library compiled with Gcc...
But you can convert the file in AVI/MOV with codecs RLE or YUV.

In Gimp version 1.2.3 for Linux and Windows these plugins are not included.
The docs don't mention them and don't give an URL either, furthermore is it
legal to add that plugin?

>As far as IMG. Could you tell me why it would be any good to support IMG?
>Even on a 100% TOS world. Why would you choose IMG? can't support JPG? or
>gif, or tga? tiff? or PNG?
>Those offer advantages over IMG format.

Are you serious?
Just in case you forgot: this is the Atari platform, IMG has established itself
over the years as a standard. All of our graphic apps support it, people who
are crazy about a "cute looking desktop" need this format since both Thing and
Jinnee only support IMG. All the Atari OCR apps work with IMG, and people who
edit/construct icons need IMG as well.
When you advice me Gimp as an app which is "just as good or better" then what
commercial Atari apps offer, well, then I expect it to support *at least* the
popular Atari formats.

>Please explain yourself as why you would like to work/store your images in
>IMG?

Because I'm a *real* Atari user... you probably haven't noticed but there still
are quite a lot of users here using a 68000/4Mb monochrome system. For these
people IMG is a blessing, even a large monochrome IMG loads very fast, they can
edit and/or print the pics with almost any graphic app, and almost every word-
processor, DTP, spreadsheet or productivity app supports the format.
Converting a GIF, TIF, JPEG or whatever isn't really all that easy either, there
are only a few apps available which can convert to IMG, and preserve the correct
colour palette....

Cheers from Belgium
Dennis

>
>I don't think tht FreeMiNT becomed slower during the years of developement.
>His memory requirements are bigger, yes, but lots of it is for I/O caches to
>actually spedup the system.

I know that both freeMiNT and MagiC didn't get slower over the years, MagiC 6.2
is 0.1% faster then the previous version, but they both need much more memory
then the first versions.
Also over the years we've became more demanding: NVDI, colour graphics, hard
disk driver, caches, CD-R driver, Acc's, a decent desktop program etc... all
these *must have* utilities consume memory... Someone with a 4MB configuration
wanting to run either freeMiNT or MagiC will find himself struggling constantly
with memory limitations. Isn't the point of multitasking to run/keep several
apps at once in memory? I've always advocated that people should upgrade their
outdated machines and replace it with at least a Falcon or TT, but the reality
is that the majority of the Atari users didn't, ignoring these users is equal
to ignoring at least 50% of the existing users base. That's one of the reasons
why I constanly nag here about apps that should be GEM compatible and run under
SingleTOS...

>On the other hand MagiC does not allows to use polish characers, and I doubt
>it will, maybe if developers will add solution similar to FreeMiNT's then it
>will.

In Flemish (my native lingo) there aren't any special characters but Finnish,
Spanish and Turkish pose no problem under MagiC and these languages do contain
some special characters . A proper keyboard sys file is needed and in magx.inf
one has to assign the proper TTF fonts...

Cheers from Belgium

>/temp/*.gif" and happily got back to work.

Hi Galen!

With Thing you would have just needed to hit CTL-E to bring up the
Mask dialog preloaded with all extensions in the open window,
choose *.GIF then Ctrl-A to select the lot and hit Del (with
jinnee it's even easier!). All right, not quite as fast
as your CLI, but it does let you check what you are doing.

Personally, I only use a CLI when I have to with a TTP, but don't
like having to type in more than the partition name. With HCP you
don't have much option, but remembering all the switches and
typing them in correctly in the right order isn't easy. If there
was as GUI alternative, I'd use it. That's why I used 2-in-1 for
de/archiving, though have changed recently to Arcview. No CLI, no
GEM dialogs - just drag-and-drop.

Regards, /Peter/

Hi matthias!

My guess is that you are missing the point. If the PC can't read the disk, then I doubt that either an Atari emulator or any other tool can help - and you can't even change the boot sector as the disk won't be recognized! You need an Atari - usually they can be bought very cheaply, and you don't need anything more than a basic 520STFM. Then run DISKMOD.TOS with BLOCK0.DAT in the same directory to write an IBM-style boot sector on the floppy without affecting the rest of the data. Make sure the Atari has a double-sided drive in it (720 KB) because DISKMOD won't work with single-sided disks and the modern PC can't read them anyway!

>Those offer advantages over IMG format.

For monochrome images, IMG with RLE compression is one of the
most compact lossless file formats. To some extent this it true
with colour XIMG too, though TIFF is probably better. GIFs tend
to be very large. JPG is OK if you don't want to do any furthr
work or image processing - but it is lossy so you lose some
quality.

If you are compiling HYP files then ST-Guide (or rather HCP) only
accepts IMG, ICN and IFF - the latter in 16 colours preferably. So
I for one use IMG for mono and IFF for colour screenshots.

They may be included or not (depends on the distribution) becouse of legal
reasons (GIF is patented) see www.gnu.org/gif

This has nothing to do with beeing real Atari user.

Yes there some some data formats that are binded to our platform (RSC for
example) but as for image format IMG is just one of very much formats. They
are formats that are much more atari related like PIx, NEO, SPC.

> Cheers from Belgium

Belgium does not exist! http://zapatopi.net/belgium.html Explain yourself! ;)

This is not only keyboard/fonts problem (this can be solved easily) but vfat
filenames problem as thy use Unicode and MagiC lacks machanism to update the
translation table to support aditional characters, ie. I cannot use my nice
polish letter in filenames under MagiC.

Hmm, it seems you're right. I didn't upload that archive myself. I
usualy check the archive in the incoming dir but this time, due some
lack of time I didn't.
To avoid problems I've deleted the archive in question.

CU,

I know there used to be a couple different devices that allowed you to use a standard PC keyboard with a Falcon, but what's still available, and what's the best solution?

If it makes a difference, I'm in the USA, so if you know of a North American vendor that carries these devices, that would be helpful.

Thanks,

-Paul

The original example was not very good.

What if you have:

my_folder/day1/pictures in here
my_folder/day2/pictures in here
...
my_folder/day9/pictures in here
etc.

Then you need to delete all the gif files and leave all other format
intact.
But you only want to delete the ones that were taken from day 2 to day 7
as it was a really rainy week.

How would you do that elegantly in jinnee or thing or whatever desktop
without using a CLI?

One command in bash and I am done.
Meanwhile, you'd be opening each folder manually (and if there's a bunch,
you can spend a good hour).
Very efficient to your eyes?

Hi, Hallvard: I quote from my manual -

Switch on. When the power light comes on, immediately hold down ALT.
As sson as the floppy drive busy light comes on, release ALT. Wait
several seconds, then press any key. After short delay the desktop
displays, containing three icons (A and B and Trash) and a menu bar.

The three important words are "immediately", "release" and "press".

>For some uknown reason, whenever the harddisk driver is loaded from the
>boot floppy, the harddisk takes over, loading the desktop (NEWDESK.INF)
>file and ACcessories (but apparently not the AUTO programs).

It will load an .INF file and AUTO folder on the floppy. It won't load
those on the HD, which won't be recognised. BTW, you need to have either
AHDI or HDDriver *not* in the floppy's AUTO, but elsewhere on the disk,
so that you can run it independantly when you are ready.

Regards,
Charles.

I've it working now. I have two Qed version on the same partition:
/qed v4.53) and /qed-beta. If I rename /qed/qed.rsc into /qed/qed.rf.
the beta version will work.

Martin

4247. A new tool for translators

Newsgroup: comp.sys.atari.st
Date: 2002-05-12 22:44:32 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <abmr8g$t4s$1@thorium.cix.co.uk>
Source record: 34900

Hi!

R G Faika (Luna, Arthur...) has made available an invaluable tool for translators who are having problems finding the exact keywords in the program file that call the relevant page in ST-Guide. (OK, I was :-) but others should also find it useful.)

It's called St-Guide-Trojan and can be downloaded from
http://www.rgfsoft.com
The archive contains both English and German versions.

The problem it solves is due to the fact that in many programs these calling keywords are also used for other purposes, such as window titles and/or in dialogs, so they *have* to be translated, usually with a hex editor. But the (English) translation is often shorter than the (German) original, leaving spaces between the keywords. Afterwards it is almost impossible to tell which space(s) belong to which keyword. And at times it is not obvious just what the relevant keyword for a function is.

To use the Trojan, disable the real ST-Guide by renaming .ACC to say .ACR (for 'real' - not ACX!) and unload it, rename the Trojan to ST-Guide.ACC and either start it with a double-click (under Magic etc) or reboot. After this every call for an ST-Guide page from using Help buttons in dialogs, or in some programs Ctrl-clicking on a menu entry or icon (as in PixArt), brings up a small alert showing both the name of the HYP file and the page reference called. Both are enclosed in quote marks so that you can see any leading or trailing spaces clearly. It's useful for checking whether some items don't have a link, too.

After use, disable the Trojan again and unload it, then rename .ACR to .ACC (or ACX) and restart the real ST-Guide.

I was most impressed with rgf's work. I mailed him about the problem I had been having with a certain multi-page program, and he ran this up on the spot in 20 minutes so I had it the same day! Many thanks!

Regards, /Peter/

>

I also have it working now. My analysis of the problem:
I had an environment variable set with

export QED="D:\QED\"

in my xaaes configuration file. When testing the new QED version, QED
looked for the rsc file in the directory of the old QED.

This is not a bug, it's a feature that makes it easier for me to call QED
from the bash, or as an external editor for some unix apps. (On my setup
/usr/bin/qed is a symbolic link to /d/QED/QED.APP.)

The following is an MS-DOS program that allows conversion of old ST disks to
make them readable by a PC. Do NOT use it with executable boot sector disks
(ie: games) and if possible, only use it on a copy of the disk. This program
messes around with the disk's boot sector, and if anything goes wrong, chances
are your data will be lost.

ST2DOS.EXE

I rate ArcView strongly too, but it does have problems deleting individual files from within archives (ZIPs tested) under MagiC 6.10 and 6.20. TBH this is probably more a problem with the actual TTP that does the work than the shell itself...

Cheers

Cant find it in my manual either (though I have a 1.0 manual with a
2.0 update), and I dont think it was implemented in CAF 2.0.

I thought it might be sync to a DAT's clock or ignore it and use
internal sync, but this is highly unlikely.

Well Im stumped too.

Zip disks or a SCSI PCMCIA device would be one idea, but not cheap if you
have to go out and buy the stuff. Also ethernet, if you can get hold of
such equip. for your atari.

> ive been doing things through the modem port only at 19200 baud, isnt one of
> the serial ports able to go much faster ? what programs would i need to

Yes, Modem2 or Serial2 will go faster, up to 115k baud. I used STalker at
the time, it's comercial. I would suggest a program called Connect or
Connect95. Perhaps someone else knows more here.

> can i use the parallel port? also what programs would be required for both

huh,
I think the thread turned into something different, Thanks Dennis!

Gimp is a content creation software mostly.
That is you gonna create picture, then save it into whatever format you
need.(tif, tga, ping, jpg whatever!) then if you need to insert a picture
into your atari program, I am sure you'll find a converter from jpg to
IMG if the program does not do it automatically.
I don't see what the problem is.

Besides converting from one format to another if needed is not like
converting mp3 where it would take hours, here it's just a matter of
seconds.

Ghost allows you to use actually map the drive, something like P (in GEM) would be C on the PC. You can even make multiple connections between up to three PCs (if you have the ports).

However I have just found that very large files does not work to well on my Falcon, 25mb or so, it gets to the end and then says there is an error, not sure what is causing the error though (Ghost, GEM or harddisk).

YOu may be able to buy it from Systems For Tomorrow, but I do not know
if they have the latest version. http://www.SystemsForTomorrow.com/

Of course I would buy it from the Atari WorkShop in the UK. They have
the latest Egnlish version, 8.11. I just upgraded my Jinnee program to
version 2.5 from these people. They are great.

Hello,

If you want to use the Parallel port, then I suggest PARCP. I have and
use it between my Hades and my STe/wife's PC. Works great. You can
download it at the site below. It needs a special cable. You can either
order it from the author as I did or else build it yourself.

You just don't stop to impress me.

1) you complain that gimp does not support GIF.
To which I answered.
2) realizing that, you insist on the fact that it does not support IMG.

IMG is an atari ONLY format which ONLY really support 8bit/pixel.
The 24 bit/pixel as far as I know was never official and got many
variants.

So what are you gonna do with the IMG format?
Use converter.

Your whole argument that IMG is good because it was specifically design
for atari just doesn't work. Do you also use PIC1?

Question to you:
When in Jinnee or Thing you have to have a jpg/gif/png background that you
just downloaded from the internet, what do you do? convert it to IMG or
just pass it coz it's not your native format?

Now, when you convert it "down" to IMG, do you like the size it then
became on your harddrive? or maybe you like the way you had to dither it
(unless you use the 24bit x-img version which is not standard from 1
application to another if they support it at all).

Anyway..

Hi
Maybe the boot from C drive settings is making it do this. HDDriver may
think it is booting from C & then loads everything from C:.

I think that is just the normal behavior of GEM, always reading
NEWDESK.INF from C: if C: is available and NEWDESK.INF is present on
this drive.
HDDRIVER and AHDI do not interfere with anything related to how the
desktop handles NEWDESK.INF.

Nowadays I use Mintnet/gluestik, but I have used STiNG with MiNT without much problems in the past, simply from the Auto folder.
The HSmodem stuff and STiNG I had put AFTER mintxxx.prg in the auto folder. (I also used devset.prg instead of all that cpx stuff that you need. But that's not essential.)

Are you able to use STiNG under single TOS ?

Martin Tarenskeen

4290. ST Format Disk Images

Newsgroup: comp.sys.atari.st
Date: 2002-05-14 09:18:00 UTC
From: Wef Dinaini <not@here.com>
Message-ID: <3ce0d647$0$227$4d4ebb8e@news.nl.uu.net>
Source record: 34942

Hi All,

the default link pointing to the ST Format disk archive (on ecs.co.uk) seems
to
be deceased; I can't enter the site anymore (404). I've tried several
browsers
because you never know, and I have tried Google'ing for other sites which
have
what I want - I dug up my 1040 STfm and disks but cannot read about 98% of
my
old ST Format disks anymore *sob*.

So, does anyone here know of an alternative website or ftp I can try ?

Thanks in advance,
Wef

I have not followed this thread in its entirity so forgive me if I am
mentioning something that has already been suggested but I was
wondering,
have you always had driver software installed on your HD when you have
tried
this?.
If so then re-create the situation you are trying to cater for by
deleteing

it and see what happens then, in theory this should prevent the Mega from
being able to access the HD and force it boot off the Floppy thus using the
floppies NEWDESK.INF file.
It's been a while since I've had to install HD Driver but I think you will
be able to to re-install the HD Driver software from the floppy while
retaining the current contents of the drive, but I suggest you confirm this
before you remove all the driver software from your HD.

I've got it, with original box and disks, but I don't think my 7 year
old would want me to give it up! Sorry! I wonder if it could be
released in some way? Perhaps we should put it on the Orphaned
Projects wish list?

I have a problem with some IBM SCSI hard disks that I have, they only work if I turn the Auto Start off and let HDDriver start them up.

The problem with this is that I have to turn the Hard Disk off whenever I have to restart the Falcon. The disks appear to work fine on a PC.

Any ideas?

Elliot...

And the same happens if you don't have any harddisk at all but a RAM disk
as drive C. That is why better RAM disks usually use drive D.

> IMG?

I am afraid that I, too, must ask here "Are you serious?" It has nothing
to do with being a politically correct "real atari user", but it has much
to do with te fact that this -is- an Atari platform and that an enormous
number of applications on this platform support IMGs and do not support
TIFFs, JPGs, etc, whatever advantages the latter have. And even those
advantages are, sometimes, dubious:

>That is you gonna create picture, then save it into whatever format you
>need.(tif, tga, ping, jpg whatever!) then if you need to insert a picture
>into your atari program, I am sure you'll find a converter from jpg to IMG
>if the program does not do it automatically. I don't see what the problem is.
>
>Besides converting from one format to another if needed is not like converting
>mp3 where it would take hours, here it's just a matter of seconds.

Unfortunately, it is NOT a matter of seconds. For example, my work often
requires that I make at home some black/white illustration, mostly
some technical sketches and schematics. Those are often full-page A4 size
300dpi pictures (cca 2400x3400 pixels). I must load and save them several
times, edit, cut, paste, etc. On my 4MB MegaST I can do that quite
comfortably with IMG format, indeed in a matter of seconds. My machine
is completely up to this work. If I were to use JPGs, each picture-loading
would take about 10 -minutes-. Saving/loading as a TIFF is faster, but
still takes an appreciable amount of time.

So, as long as I work on my Atari, I see no need to use other formats.
This question arises only when I am sending or reciving pictures
to/from other people. THEN it is appropriate to use a convertor program-
once, after a day's work. And then sometimes I run into strange
problems: once I had to convert some work to JPGs for someone, because
he complained that he could not read TIFFs on his PC- this file type
was not assigned to any applications on his machine, and he was not even
aware that he had to do so. As for receiving picture files from people,
many graphich applications in PC world happily ignore the fact that

TIFFs can be saved in "compressed" form, and in black-and-white,
and so they create multi-megabyte TIFF picture files (which I have then to
read from my e-mail) when properly-chosen TIFF options would have created
a file many times smaller (btw. a black/white/compressed TIFF -is-
usually significantly smaller than a black-white IMG).

As for "doing it yourself", indeed I had to do it sometimes, by coding
appropriate little utilities, e.g. when I had to load pictures from
PCL print-files (those for HP laser printers), or to import/export "sixel"
pictures (a weird and very compact DEC's format, compatible with their
graphic printers and terminals, high-resolution pictures being completely in
readable ASCII).

>It would only be of use to someone using some ancient TTP software

The important fact for me would be that it works like an accessory, which
enables one e.g. to do some file opertions from within any GEM application.
IIRC when used as an accessory it is even supposed to run well-behaved
GEM programs, which might make it useful as some sort of task-switcher
in a single-tasking environment.

I suppose there is not much chance, then, of finding the full version
somewhere on the net :(

As of now the release of Daemon's Gate was a bust. I have lost
thousands of dollars, hundreds of hours and received negative E-mail.
I spent over $70K buying all of the computers from Atari
Engineering whem they layed everyone off. I have many more unreleased
Atari titles. However for now, all future releases are on hold and
I'm not shipping anymore Daemon's Gate.
For those faithfull Atari fans that did buy DG from us please pick
2 titles for each Daemon's Gate you bought and I will send them
to you new in the box at my cost.

LYN045 BASKETBRAWL
LYN033 BILL AND TED

Maybe if the source code is available then someone could finish those
titles.
That way there should be more interest.
Which other titles are there? Relief pitcher etc.?
Assuming of course that would be legally ok...

I fail to understand.
1) image creation
2) creating documents importing images.

Two different processes.
From step 1 to step 2 you'll have to convert if your app can not import
pictures correctly.

Image creation: color calibration, effects, pixel drawing, scanning, blur,
crop, working with multiple layers whatever, you name it.
IMG is just cut out to handle that.
IMG is only good as a FINAL format, ready to be imported into other
applications if you want to use the picture.

This does not apply if you only work with 1 bit pictures like in your
case.
For you I recommend megapaintST from 1986. It will do wonders.

> >That is you gonna create picture, then save it into whatever format you

If you were to use JPEG for 1 bit images, I understand your problem.
How about using a shovel to stick nails in the wall?
Same thing.

> So, as long as I work on my Atari, I see no need to use other formats.

I perfectly understand now.
Yay! for the advance in technology, for graphic compression algorythms,
for all the graphic cards vendors for atari. (Mario B., just don't
worry about producing the Galaxy, users here are perfectly happy with IMG
mono).

This will make no difference. The desktop will load NEWDESK.INF from C:,
if present, and whether the hard disk driver was loaded from a floppy or
the hard disk is not important.

Sure, you cannot simply delete the .SYS file. This is not the correct
way of removing a hard disk driver. Hard disk drivers must be removed
with the tools provided for that, e.g. HDDRUTIL or HINSTALL.

> -When the harddisk driver (i.e. HDDRIVER.PRG) is NOT located within the
> AUTO folder of the boot floppy, but instead run manually from the floppy

This does not sound logic to me. In order to run HDDRIVER.PRG manually
the desktop must have already been loaded. Otherwise you would not be
able to double click HDDRIVER.PRG. Since the desktop is already active
NEWDESK.INF will not be read anymore at this point.

> -Hard drive icons aren't shown on the desktop unless the drive(s) have

That's what the Atari manual says as well I guess ;-).

It's incredible... And the "directory tree" image is also nice ;-)
Pity it's only in HTML and not in HYP (HTML is quite slow even on TT,
not to mention ST/STE to which TOS 2.06 is meant for...)

But anyway, I am impressed by the amount of work you have put into
that guide!

Hi Grzegorz,

>Could you please tell me how to "subscribe" certain newsgroups
>with Okami? Each time I start it new posts are imported to "JUNK"
>folder.

I had similar problems when I first started, but I think it is
in active.dat, in your STORE folder. Any posts from newsgroups
other than listed in active.dat are put into Junk. To actually
download posts from groups, that is to do with Newswatch and
it's nntp.dat.

>And also, what to do when I want to send some posts? I replied to
>some posts (imported to JUNK), the replies were placed in "OUTBOUND"
>but when I start Newswatch and try to post them they are apparently

Did you export? Once exported they are placed in the OUT
folder, and when Newswatch is run it'll check that folder, if it
sees some news posts, it'll post them.

I think this is working by design, to cater for folks like me with
non-bootable hard drives.
I have an STE with an IDE interface but still have TOS 1.62. and so I boot
AHDI from a floppy.

I don't want to have to store all my CPX's etc on the floppy so I want the
thing to load the desktop
info file from the hard disk.

Ghostscript (free) and Porthos (commercial) will both read PDF files (with
varying success, it must be said).

Ghostscript (1.3) can be had from
ftp://chapelie.rma.ac.be/atari/editors/ghostscript

English docs and resource files from the MISC section of my web site.

Cheers

Derryck

Hi !

I don't know if there are a lot of solution available now to use
a PC keyboard with a Falcon, but to solve this problem i designed a
small interface which allow to connect any _PS/2_ keyboard AND _PS/2_
mouse to any Atari.

Have a look to my web pages...you can build it yourself because it's
a free project, schematic and all required are available or contact me
to discuss how i can send to you an Eiffel interface.

Best regards
Laurent

One thing to look for is the Unit Attention Jumper.....if it is fitted,
take it off, if it isn't try putting it back :-)) I use IBM drives and
they all have wierd features that you generally have to disable....then
they're some of the best drives on the planet

Are you starting aFTP from U:/D/aFTP/ or from the drive directly?
You have to start it from U:/ because otherwise it cannot find
etc folder (resolv.conf, services and all those files). In fact it
looks for it in the root directory of the drive it has been started
from (why? - good question), so either start it via U:/ or copy your
complete etc folder to the root directory of the drive you have aFTP on.

Hi David,

>As I am just looking to network enable my STs I was wondering why you would
>want to replace NEWSIE?

I only started having problems on my Falcon. Newsie would
sometimes crash, quite often if a large attachment was on an
email. It would destroy clusters on my harddisk, which
eventually took out the whole partition. File names were fine,
but contents destroyed. I was very angry as some work was on
there, but really it was my fault for not checking (use optimise
program) and backing up. I switched to Okami, not had a problem
since.

I'm really sorry to hear this, especially since I was going to try to purchase a copy next week. I realize that it is not a complete game but I still wanted to see what they were doing and see if I could get any ideas from it. I think that maybe everyone's expectations were too high on this release. The game is obviously functional but not complete (which is why it is an unreleased game) and if people had purchased it with that idea in mind I don't think that you would have had as many complaints.

In the future you may want to run a small batch (or even a dozen hand made carts) and offer a special release to past customers or people that you know would be good beta testers in order to get their feedback. If they state it's totally unusable then don't release it. If they can provide you with a list of limitations or problems then list those issues up front on your web pages so people can see them prior to purchasing it. I'm sure some people would still complain because they don't want to believe what they read and want to think that it will still be perfect but it should cut down on the number of complaints.

I compliment you on trying to release the game. With so little new coming out for the Lynx & Jaguar systems (songbird can't produce everything) it nice to be able to get what we can. Hopefully you will continue to try to provide any new stuff that you have and not let it fade away into the past as with so many other projects that were in the works but never saw the light of day.

Just my 2 cents for all it's worth.

I have no idea! I'm just curious when you say stability, are you
talking about pops and clicks, or something else?

Wayne

Hi Raoul,

>Which reminds me: is there any news from Tempus Word?
>If I get in touch with the programmer I don't get a
>reply.....

Yep... version 5.12 is now being betatested, but it needs an "expanded" Atari,
minimum requierements are a 68040, graphic card and 8MB free RAM.
I'll keep you up to date... the programmer has a different email address, and
asked not to make it public.... the website should be updated real soon and
will have an English and French section.
http://www.tempus-word.de

Cheers from Belgium
Dennis

>You can find the German version on
><URL:http://heinisoft.atari-users.net>

A bit off topic but what the heck...:
People, who find QED to limited for their needs, should take a look at Luna
from RGF soft. There's a new public beta version 2.09 on the website ready
to download.... furthermore Luna is now freeware.

Maybe one day, when I feel like looking into it again, I will understand
why people like Okami so much.

But until then I will keep wondering why things have to be so complicated.
Three different programs that have to be configurated, tons of options
that I don't need or don't understand, and all I want is to get and read
mail or news from my ISP, and post mail or news messages. And I don't
want such simple actions to be more than one or two mouseclicks away.

I have about 6 of them and not one has any jumper settings on them, they have jumpers just no indication of what they do. The net is not helpful nor is the IBM website. I have tried every combination but have only found the ID and Auto Spin, probably enabled the parity a couple of times too but then there are only a couple of others jumpers left.

They are 2Gb SCSI (both 50pin IDC and 68pin D type), they do not appear to have many marking either, I will look closer.

Here's my latest list of items for sale. Many prices have been lowered. I'm moving soon, and the less I have to pack/shift/unpack the better!

For full details and prices, take a look at the following web page:

http://www.coldblackroom.demon.co.uk/for_sale/atari.htm

Offers or enquiries to ash@coldblackroom.demon.co.uk

It's also possible some of you might be interested in some computer books (not Atari-specific ones) and music hardware I'm selling. Go to the following web sites for more details:

http://www.coldblackroom.demon.co.uk/for_sale/books.htm
http://www.coldblackroom.demon.co.uk/for_sale/music.htm

Finally, is anyone interested in 31 issues of Sound On Sound magazine from 1998 to 2001? Offers for the lot (no splitting), but buyer collects only (I'm in Buckinghamshire).

best wishes,

Ash

What does 'invisible' mean?

You should not 'hide' the drive from HDDRIVER and you should provide a
desktop icon for your megafile.

Hi Alex/Reizla,

> Do you also know of any non-Mac compressed file? I'm running > Windows, and don't know how to read the .hyp file...

*.hyp is "Atari-based" (ST-Guide), non-Mac!

It is an essential Atari-help-format.

Using Windows, you can view Atari-hyp-files with "WinGuide.exe" (by Frank Rï¿½ger). URL something with ?.dnsalias.net ?

Werner

>IMG is just cut out to handle that.

Yes, I agree with most of that; IMG is not very much suitable for anything
involving colour or grayscale.

>IMG is only good as a FINAL format, ready to be imported into other
>applications if you want to use the picture.

In fact, if the application is one of those that can handle -only- IMGs,
it will probably not be able to display all those fine effects stored
in other formats, anyway. If one is to use such applications it would
probably be a waste of time to create wonderful hyperrealistic pictures
in true-to-life colours.

BUT if one is involved with artistic or photo-quality imaging, yes, I agree
that other formats should be used. What I wanted to say is that IMG should
not be discarded COMPLETELY because, on this platform, it is a widely
supported format which is useful in some cases. (btw. I seem to remember
that in the PC world, Corel applications, having some inheritance from
GEM-based Ventura, support GEM and maybe even IMG picture formats).

>> So, as long as I work on my Atari, I see no need to use other formats.
>Yay! for the advance in technology, for graphic compression algorythms,
>for all the graphic cards vendors for atari. (Mario B., just don't
>worry about producing the Galaxy, users here are perfectly happy with IMG
>mono).

Oh, but note the repeated use of "I" in my sentence; I was presenting
-my- case as an example where this IMG image format is convenient and some
others would not be. For other users it may be different. My intent was
to show that one should not cathegorically dismiss IMG format.

(as for Galaxy, marvelous as it is, it can not be fitted in my MegaST).

>This does not apply if you only work with 1 bit pictures like in your case.
>For you I recommend megapaintST from 1986. It will do wonders.

In fact I -do- create most of my work in Megapaint- but that is Version 6,
from 1993. Indeed it is a superb application for technically oriented
graphics, and it has acquired some useful functions since the early versions.

I second that. My IBM DSAS3540 drive did not want to boot without the
proper setting of "unit attention".

And indeed, it is a good drive. Very, very quiet.

Did you not find info on IBM's site? I found data for my disk there.
At that time the url was http://www.storage.ibm.com

On my disk the jumpers are in a block of 7.

The first 3 (JP1-JP3) are the usual SCSI ID. Then:

J4 Disable Auto Spin Up - should be OFF.
J5 Disable Unit Attention on startup- should be ON.
J6 Terminator Connect - ON if last device on the bus.
J7 Disable Target Initiated Sync. Negotiation - ON.

And, no, there is no external LED connector :-(

The catch with "unit attention" was that J5 has to be ON for my disk to
be recognized and boot- and it was initially it was set to OFF. I have
read an article (in German, unfortunately), that says (as much as I
can understand it, my German is REALLY very bad) that a drive sending
"unit attention at startup" has a problem with versions of TOS before 2.06,
because it sends one response more than TOS expects, and they can't establish
communication; in later TOSes this was rectified by TOS searching for
the HD twice at boottime.

> Regards, Robert

Back to work, doctor took the staples out yesterday. I am not to use
the arm for work for another 4 weeks....he didn't say about working on
Atari at home:) There is no cast, just an arm sling. He used wire and
pins to put the bone back together...

My Afterburner is once again running after being apart for several
months (lack of interest?). only black screen at first:) Forgot that I
do not have the powersupply modification for PC supply on this
motherboard, must always warm reset the Afterburner to get it to
boot:) All is ok:) I have tested the SCSILINK only a little bit. I
think there is a DMA problem with the link attached and the STinG
drivers loaded. With HD Driver demo V8.1, Falcon bombs (2) when
loading the driver. With HD Driver V7.55, driver loads ok, but the
floppy stops working. Link cannot be communicated to with utility TTP.
I have tested the Falcon extensively, the SCSI bus produces no errors
normally. Falcon works normally with link attached and STinG drivers
removed from STinG path.
Funny thing I noticed was if the FRB option is active in HD Driver
V7.55, the Afterburner TKROMDRIVER will crash. I normally just use
NVDI for the FRB, running it right after TKROMDRIVER, but thought to

experiment with the FRB option incase the STinG driver is doing
something funny there with the AB MMU programming.
I have email Roger with info on my system, I am sure he will look into
this soon.

Regards,
Mike

You make some good points, Glitch. I hope Bruce doesn't go
heartbroken from this failed release, and heeds some of your
advice for the future. To be honest, I don't know what Bruce
was expecting. Foremost, trying to use his ignorance of a game
as a way to get people to believe it is complete, thus tricking
them into buying it. Bruce, of course you're going to get negative
E-mail then, when people realize that you were misleading them,
whether intentionally or not. Just give us the facts, Bruce,
and that leaves much less to complain about.

I'm also somewhat offended, that Bruce is suggesting that only
the 'faithful' Atari fans actually bought Daemon's Gate from
him. To the contrary, if you ask me. It was not bought in mass
quantities because, as a community, we have grown into more
intelligent consumers. And this bust of his has proven the fact.
Just because we are thirsty, doesn't mean we will be grateful
to pay large fees for a glass half filled with water, whilst
the vendor assures us that it seems to be full, but he really
hasn't had enough time to make sure of the fact. If the glass
is only half full, be honest with me. I can still appreciate
only that, as long as it's what I expect when I buy it.

Don't get me wrong, I do have some appreciation for Bruce's
efforts. Surprises are great, but in the future I hope he will
discuss with the Lynx Community his future prospects. Then
we might decide together what is in our best interests, before
Bruce invests so much time and effort in the matter.

Realize, I've got nothing but love for you, Bruce. But we need
to be critical of the ones we love, so they do things better
the next time around.

Sorry for the ranting.

-vick

The Unit Attention jumper has no meaning unless you are using old
versions of TOS. Until TOS 1.04 the drive must not send a Unit Attention
signal when it is accessed the first time, otherwise TOS will not be
able to bootload the hard disk driver. For newer versions of TOS this is
not a problem.

> connected.

No, it isn't. Note that there is no magic behind all this. Mega STE, ST,
TT, ... all behave identical with respect to booting and the mechanism
how to boot is well-defined.

> I'm not sure what you mean, but I've tried the above many times just to
> be sure my documentation of all this is correct.

If I understood everything correctly you said that if you run HDDRIVER
manually from floppy, NEWDESK.INF will be read from floppy disk. This is
impossible since in this case the dekstop will already be initialized
(and thus has already read NEWDESK.INF) *before* you started HDDRIVER,
which you must start by double clicking HDDRIVER.PRG from the desktop.

How about if you boot from a diskette with Auto folder that have the
HDDriver in it?
Will the newdesk.inf be from the floppy or the drive c:?

Is anyone having trouble with the links in the html files, after
unpacking GUIDE206.ZIP on a case-sensitive etx2 partition (MiNT !) ?
Don't panic. Just copy the whole lot to a normal FAT partition. If you
really want to have the files on your ext2 partition, just copy them back
again, thus converting the filenames to lowercase.

And rename "\guide206\images\opt14gif" to "...\opt14.gif". After that the
TOS 2.06 will be really really good.

(Explanation: the filenames in the ZIP archive are UPPERcase, the
filenames in Hallvards html code are in lowercase...)

Martin Tarenskeen.

>Okami etc ?

Newsie is useless if you happen to write or read newsgroups in languages
that need 8 bit characters.

characters like ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ etc will show up as rubbish in Newsie when you
read messages. When you post yourself no others (except other Newsie
users) can read your text properly.

If message headers are Quoted Printable encoded they will look terrible
in a newsreader that doesn't understand this encoding.

If you only use English you will not have these problems but for many
other languages Newsie is not a serious alternative.

But, if you alter the Atari character set with some other software
(Harlekin etc.) it is possible to write with Newsie in a more compatible
way, but then things are not that easy any more...

I'm a bit outta LA area, in Paris here :)

> I can bring the floppies of the
> Notator MIDI files to you and convert them to DP there or whatever
> makes sense?

Thus I guess it'd be more convenient to pack them in an archive,
ie lzh, zip, 7zip, gz, whatever u have :)
and send them to my mailbox or to put them on a site of yours
and email me the URL so I'd DL them to translate the
NOT or LOG or LSO files to MIDIfile format :)

> Please advise ASAP.

Sorry for the delaying but I was in a hell this week
and didn't check all the usual news :-(

Tell me if u could manage differently and don't need help anymore,
no trouble :)

Though I have to warn u that the transfer to MIDIfile
can be hazardous with some files, especially depending
on the versions of Notator or Logic used and are really
a lot of trouble with intricate structures of arrangment
and especially when the environment (synths, exp, FXs, etc)
is heavily specific !
Then you may not wait for a miracle from me but at least
you may have all your sequences :)

Ahrg.. :)

> motherboard, must always warm reset the Afterburner to get it to

You changed start sequence of programs of autofolder?
Try to load sting as last.

I also had problems with later haddriver releases as 7.8. That works
fine and never change a winning team ;) I doni¿½t know what other features
newer hddriver releases had. 7.8 works great on ct2.

> I have tested the Falcon extensively, the SCSI bus produces no errors
> normally. Falcon works normally with link attached and STinG drivers

Sounds like touble with different drivers on your system.
Sting normaly does not bomb on falcon if the setup is ok.
That sounds for me like trouble with any other driver.

> I have email Roger with info on my system, I am sure he will look into
> this soon.

Yep, rogers website says the driver is tested well on tt, and it should
work on other systems. Any other report with that driver on an falcon?

Regards, Robert

>I only started having problems on my Falcon. Newsie would
>sometimes crash, quite often if a large attachment was on an
>email. It would destroy clusters on my harddisk, which

But note that at least earlier (v. 2) Okami versions had problems with large attachments too. If the incoming email was larger than approx. half the largest free RAM area it would import normally but the resulting mail got corrupted with the beginning (incl. header with the sender address!) missing!

I have not checked what happens in the same situation with Okami 3 but I always keep a copy on the server when importing large or important emails which is very easy using Popwatch.

Another glitch... When I took my old DAF car out of the winter sleep I got a mail from the authorities with a permit to drive the car. An important document that has to be in the car in case I get stopped by the police.

When imported to Okami the attachment would not be recoginzed at at all. Fortunately I kept a copy on the mail sever and could get it with Outlook Express instead.

I have not checked with the RFC's but the header looks a bit strange. Just an attachment without any delimiters so maybe Okami did the right thing?

Typically they sent it as a pdf document with a statement that it's against the law to change the content. Imho a simple text mail signed with PGP would have been both more secure and compatible...

If anyone wants to check if it's correct here are the relevant parts of the mail:

Hi Oracle

| its raining atari stuff here, just picked up a megafile for $5!!!! mint
| condition and working great!
|
| that is.. on my STE..
|
| I notice when i plug it in to my TT, its basicly invisible, it only works
| with its internal hard drive.. is this kind of thing normal ?

You'll have to make sure its got a different SCSI ID if you're using a SCSI
chain, or a different ACSI ID if using a ACSI to SCSI adaptor.

>talking about pops and clicks, or something else?

Crashing is what I'm talking about. Good old fasioned TOS BOMBS!

As I'm sure you remember, you already solved the "pop & click" riddle a while back, so that's not really an issue any more. Plus, it may just be a coincidence or dumb luck, but in my recent testing, using the JAM OUT box exclusively (instead of the Falcon's own analog output), I haven't had any pops or clicks show up in any tracks yet. Having said that, the next time I record something it'll be click and pop city! <hahaha>

But CAF is still crashing quite frequently when dealing with audio (and on rare occasion, when doing just MIDI work). These are MULTI-BOMB (at least 8) crashes that immediately send me back to the desktop. They can happen when selecting a track to record on, and naming the file, or just during playback, or editing a track, pretty much any time really. I can't pin point what causes them. And I can't count the number of bombs since they're only displayed for a split second before I'm back at the desktop.

I have booted on a completely clean system, and I've "reinstalled" the program from different backup copies, but it still crashes. I do have MORE stability when I boot under ICD Pro than with HD Driver. I'd say I'm about 30% more likely to crash when running under HD Driver. Why this is I have no idea.

I wasn't as worried about this for a while, because my plan was to use SoundPool's AUDIO TRACKER for digital multi-tracking, and CAF for MIDI. Well, after messing with Audio Tracker for quite a while now, I realize I really don't care for it. It DOES handle multiple tracks faster than CAF, but I can't get past some of the clumsy ways it deals with common tasks. It's NOT easy to work with, and really gets in the way of the creative flow, unfortunately...

For example, in Audio Tracker, if you just recorded a take, and realize you don't like it, you would think it's a simple matter of highlighting the section, and hitting DELETE (as it is in CAF). Well, what you have to do is click to the "Song Structure" window to make it active, set the LEFT and RIGHT locater points for the selection you want to delete, click the "play" button for that track, select "CLEAR PART" from the drop down menu, and then wait about 30 seconds for it to do it's thing. Of course, don't make the mistake of accidentally using "DELETE PART" from the drop down menu, because this function also shifts everything after that part to fill in the spcae you just "cut" out. I found this out the hard way!

Picture the above scenario when you're trying to record a vocalist who makes a lot of mistakes and you'll see how quickly this becomes annoying and impossible to deal with: "ok, you were a little flat there, give me a minute and a half and we'll try it again..."
:-(

So, out of necessity, it's back to CAF for my vocal and audio recording. If I could only figure out why it crashes so frequently, things would be ok. It's strange, because I used to use it in the past without incident. It seems like it's gotten more unstable with age. And the only thing I can think of that's different now than when I first used CAF on my Falcon (back when I only had ICD Pro) is the Nemesis accelerator. However, turning this completely OFF does not seem to improve the situation either.

I'm stumped.

On my Nemesis-enhanced Falcon (using the Videlity software), I can set up a nice high resolution(larger than normal) 2 color screen resolution, but when I try to run CAF, it changes the resolution back to the default screen size as soon as the program loads.

Does CAF simply _not_ work with anything other than the default Falcon 2 color screen size?

Those that understand German (!) should check out DISKUS:
http://www.seimet.de/diskus_english.html. The demo version is available
for download. DISKUS cannot only optimize hard disks but also checks for
errors, repairs broken FATs, directories, can send arbitrary SCSI
commands, ...

I know some people who removed the Nemesis due to stability
problems, even when it *was* switched off. Perhaps your RAM
board needs reseating, TOS chip? I recently did this, and
things seemed to have improved quite a bit!

That's perfectly OK.
There is no attachement in a *strict* sense, because the message is
not MIME/multipart (ie. it is not divided into text part and
attachement part). There is only one part, which is the attachement
itself, encoded in Base64, being an octet-stream that should be saved
as TIP$.PDF.
IMO the header is not strange :-)
You could have dragged the file itself (from the desktop) onto
MUNPACK.TTP program that comes with Newsie to depack it.

I always run aFTP from the drive directly, without going through
U: I have in my magx_rc.net inside the Magic Start folder this
line. I do use the patched mint version.

Where is your /etc path (please use a VFAT partition)
etc_path d:\etc

>I'm trying to run aFTP from U:/I:/aftp155b_MagxNet/AFTP.PRG,
>with the etc >folder in the root of U: that should work though?

The etc folder should be visible once you open the u: drive.

??? Sounds crazy. What version of CAF does it ?

> Does CAF simply _not_ work with anything other than the default Falcon
> 2 color screen size?

It does. CAF (at least a later versions I used) does work in any resolution
or color depth. I used the 1024x768x2 (Phantom + Videlity) for a long time.
Other color depths work as well, a few things are coloured in this case.

Best Regards,

Ctirad

Well, you're right but how can one to be helped if lost in a German city and
only knows German computerwords ? >Where is the festplatte to take the treiber
to Koeln ?> may not help a lot ... (-;

I learned German computer software by using them without translation and
experimenting and give you the advice to do the same. You will notice that
basic functions are at the same place in all softwares (save, load, quit, ...)
and I learned to use English software that way too.

Firsts maybe a bit hard, but after you will use the original German versions or
French ones without big trouble. Just try.

Regards

I think that you've put your finger on the source of the problem. I've a
sneaking feeling that link2u isn't actually linking anything to anything,
although I can see my etc. tmp and usr folders in the root of U: (?)

I'm trying to run aFTP from U:/I:/aftp155b_MagxNet/AFTP.PRG, with the etc
folder in the root of U: that should work though?

>from (why? - good question), so either start it via U:/ or copy your
>complete etc folder to the root directory of the drive you have aFTP on.

It works with that setup, but that surely makes a mockery of this unified
drive business?

Cheers

Derryck

>aFTP and aMail have to be patched in order to run under MagXnet.

Yep, I've used the ttp to patch aFTP - there's no utility to or mention of
the need to patch aMail though. Anyway, one step at a time.

>On the other hand, the doc. states that MiNT versions are not
>compatible qith MagXnet, and so to be careful not trying to
>patch these. All this in the doc. provided in the archive. ;-)

I can't find any mention of this in the aFTP or Magxnet archive?

Anyhow, it's sort-of working thanks to Grzegorz but some work is still needed
I think!

Cheers

Derryck

4392. HighWire .04 Released

Newsgroup: comp.sys.atari.st
Date: 2002-05-17 21:58:50 UTC
From: baldrick <baldricknospam@netset.com>
Message-ID: <3ce579c6$0$3340$6d5eecc5@news.eurekanet.com>
Source record: 34842

The HighWire Development Team has released the fourth demonstration package, as always we would like to thank you for your interest and support. At the time of the last release, we promised you some exciting developments. While we believe that we have delivered that in this package, we found ourselves in the same position that we were in last month. That is, with developments accelerating in all directions, new supports and bug fixes being submitted on almost a daily basis. We finally came to a point that we agreed to release at. Although to be honest and to peak your curiosity a bit. The truth of the matter is there are some really fun things coming in the next package and we realized, that unless we got a version out quickly we would be back into a major bug elimination phase. Faced with that situation, we decided that some of the things in this version were just too nice to have locked away for several more weeks and that the best thing would be to get everyone up to the next level.

What have we been up to for the last month? As always a quick glance at the history.txt file will give you an idea of the progress that has been made since the last release. Around 900 lines have been added to the history file, so that will give the most adventurous something to do. However we will try to condense that down a bit in this letter to give you an idea of what has been added.

Although we generally try to avoid pointing any particular team member out, we do need to specifically recognize a couple of team members for their contributions with this update.

Highwire is now Unicode compliant, with many thanks going to team member Rainer Seitel. There are some more details on this below in the section marked 'International Character Set support', And from this editors point of view, this code is a truly great addition to the open source repository of atari code, as well as an exciting addition to HighWire itself. To get an idea of the magnitude of this support open the &#65533;uni_bics.html&#65533; file in the HTML folder.

Ralph Lowinski (aka AltF4) has made major improvements across a wide range of functions of HighWire, resulting in greater speed and stability. For his continuing work on HighWire we all own him a debt of gratitude.

A few of the general highlights of this release include more hotkeys, zoom text, improved IMG tag handling, background window scrolling, scrolling via the keyboard... the list goes on. Really improvements have been made throughout the code again. Tables support has been expanded and is more robust, frame handling has been improved again. More &#65533;common&#65533; buggy HTML code is supported. And that is only a portion of the improvements.

While we have set a great task before us, our goal is achieveable, it will just take time and your support. We can always use more programmers and support on the documentation side of the project always is a critical need. Translation support for more languages would be a great addition to the project as well.

We do feel that we have something here that shows that our platforms need for an open source browser can be obtained. Currently it should not really be classified as a browser, but more of a demonstration of a parsing and rendering engine. This technology is open source, so hopefully with your support it can be the core to many projects on our platform. Not the least of which will be in the future a fully modern web browser. To reach that goal we will need time and the help of community.

I'm using the latest/final version (2.06), but it also happens with
2.03.

>> Does CAF simply _not_ work with anything other than the default Falcon
>> 2 color screen size?
>
>It does. CAF (at least a later versions I used) does work in any resolution
>or color depth. I used the 1024x768x2 (Phantom + Videlity) for a long time.
>Other color depths work as well, a few things are coloured in this case.

Well, I messed around with Videlity some more today, and finally got a
different resolution to work with CAF. I guess there was something
about the particular 2 color resolution that I had previouisly that
CAF didn't like? But I found a setting of 800x600 does work out ok.
I get more screen space, and CAF seems happy!

Anything beyond this though, and CAF begins to load, and the screen
looks ok, but as soon as it loads the DEFALT.ALL file, the screen goes
blank, and/or reverts back to the original 2 color resolution screen
size.

Thanks for the help

This is not a bug but a feature. Ext2 partitions are case-sesitive by
default and any orher situation would be a bug.

The problwem is ST-ZIP (or other ZIP program used here) that sets filenames
to upcase.

Hi Dave,

>Its a big pity my German teacher concentrated on things like trains, hotels
>and food and did not cover the technical stuff needed to understand software.

Take a look at Optimize 2.8 on Derryck's website (see sig.) Compared to Diskus
it's very rudimentary, but it can handle almost all partition types, it knows
VFAT and is freeware.... oh, and it's translated in English as well ;-)

Cheers from Belgium

Hi big master,

>As you may know by now, discussing with Dennis is just a waist of time.
>He is a master in twisting words.

Thanks for the compliment... :-))
Coming from you I consider it to be a compliment, as far as wasting time and twisting words around are concerned you truly are the master, but as you can see, I'm really trying hard to get into the same league...
Anyway, thanks for the numerous free lessons and examples you've given me in CSAST the last couple of years, all help is appreciated. I'm really honoured you consider me worthy to continue the tradition, I'll try my very best not to let you down and hope to become a real master in it eventually also.

Thanks....

Cheers from Belgium

Hi,

(I may be very wrong here but)

I've heard that this might have something to do with CAF+Nemesis - Nemesis uses something conflicts with some internal CAF stuff, and CAF resets the Nemesis to 16mhz or something. Again, I may be very wrong here.

I have used CAF in many enhanced resolutions, but never with a Nemesis.

/Peter

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Mon, 13 May 2002 12:49:35 -0500

Hi Frederic,

>Gimp is a content creation software mostly.
>That is you gonna create picture, then save it into whatever format you
>need.(tif, tga, ping, jpg whatever!) then if you need to insert a picture
>into your atari program, I am sure you'll find a converter from jpg to
>IMG if the program does not do it automatically.
>I don't see what the problem is.

Well, I can see the problem clearly, it's not about being not possible it's
about working practical, after all, you're the one that used the productivity
argument here...

Example:
Like most people I'm not a graphic artist, so when I create a pic I normally
scan something in which I like...

1. Using Photoline which is a GDPS client the scan is imported directly into
the app, after correcting the colour balance and hue I save it as IMG 8 bit.
Because I'm so overwhelmed by the result, I decide to print a part of the
picture, no problem in Photoline either thanks to NVDI...
2. I now have a nice looking desktop in Jinnee and copy on paper:-)

Using GIMP:
1. I need to scan the pic with an Atari app, since GIMP doesn't support the
Atari scanner drivers.
2. In Gimp I correct the colour balance and hue, then save it in a format of
my choice.
3. Convert the pic to IMG using an Atari app
4. Print the pic in a Atari app, since GIMP doesn't support NVDI
5. I now have have a nice looking desktop in Jinnee and copy on paper :-)

Using only Photoline I can accomplish everything for which you need to run
four apps, so yes it's perfectly possible to use Gimp, but it's not really
practical. Before you try to knock me flat with the argument that in Gimp the
pictures can be cropped, blurred, do image calibration, add special filter
effects, work with multiple layers etc...
ALL this is possible in Photoline also, in the event that I need a very
special effect not offered in Photoline, there's still Smurf to come to the
rescue.

So, here you have it....
Gimp which doesn't support *any* Atari formats, is unable to use a connected
and installed scanner and printer, doesn't have a clue what to do with CVG

and GEM, working with a graphic tablet isn't possible either and last but not least the program goes to sleep forever when you inadvertedly try to load a CFN font... and you still insist that this app, is better then anything else available on this platform?
IMO it's only usefull to add some special effects or apply a weird filter to the pics, for general work *on this platform* it's not suited... oh, and you still haven't told us the minimum configuration required to run this baby either.

>Besides converting from one format to another if needed is not like
>converting mp3 where it would take hours, here it's just a matter of
>seconds.

True, but do you remember how long it took on a 68000/monochrome to convert or even display a JPG, GIF, TIF etc...
IIRC it sometimes took several minutes, multiply those minutes with a whole bag of pics to convert, and before you know it's also a matter of hours.

Cheers from Belgium

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Mon, 13 May 2002 21:01:54 -0500

Hi Frederic,

>You just don't stop to impress me.

Stop it... you sound just like my wife :-/

>1) you complain that gimp does not support GIF.
>To which I answered.

Yes you've answered it... but:
<SNIP>
>>Gimp version on unix comes WITH GIF support (with transparency and all).
>>And gimp on Windows, you need to download an extra GIF plugin (they don't
>>want to bundle it with it because of Unisys licence thing on GIF format).
<SNAP>

I wasn't talking about the Windows version but about the very latest Linux
distribution 1.2.3, it comes WITHOUT GIF, and I also told you that the docs
don't mention anthing about downloading that GIF plugin, there's not even a
link provided... I also remember asking you how legal this is, since what it
comes down to is stealing money from Unisys.

>2) realizing that, you insist on the fact that it does not support IMG.

Not really, I used the IMG argument the very first time Gimp was mentioned
here, but you've choose to ignore it...
BTW: I don't insist that it does not support IMG, it simply doesn't. AFAIK
there are no additional plugins available for the IMG format.

>IMG is an atari ONLY format which ONLY really support 8bit/pixel.

IIRC the IMG format was introduced by Digital, it became a standard on Atari,
but it's not Atari only, Ventura DTP, GEM Paint, GEM Word are PC apps which
used IMG... Oh, and then there's Photoline 32 ofcourse for both the Mac and
PC, the very latest version still supports IMG, XIMG and in addition also GEM
and CVG. According to some gossip there's a Linux version in the pipeline, so
possibly in a short while from now, this discussion will be futile....

>The 24 bit/pixel as far as I know was never official and got many
>variants.

So what?

>Question to you:
>When in Jinnee or Thing you have to have a jpg/gif/png background that you

>just downloaded from the internet, what do you do? convert it to IMG or
>just pass it coz it's not your native format?

Answer:
I don't download it, since I don't use background pics on my desktop :-)
But seriously, IMG isn't my native format, it used to be once but just like
you I've moved on. The difference between us is that I still recognise the
importance of IMG on this platform.

>Now, when you convert it "down" to IMG, do you like the size it then
>became on your harddrive?

There's plenty of space on this hard disk...
But here are some figures, I converted an 8bit IMG file from 717Kb to several
of the more popular formats.

PCX format : 891.3 Kb
TGA format : 807.1 Kb
TIF format : 770.4 Kb
BMP format : 769.1 Kb
IFF format : 768.8 KB
IMG format : 717.0 KB <------
GIF format : 575.3 KB
PNG format : 425.9 KB
JPG format : 218.1 KB

As you can see IMG doesn't perform that bad, except for GIF it beats all the
other popular formats. I don't consider JPG and PNG formats to be very viable
formats for content creation...

>or maybe you like the way you had to dither it (unless you use the 24bit x-
>img version which is not standard from 1 application to another if they
>support it at all).

Dither isn't an argument, when you convert a 24bit JPG or TIFF to 8bit GIF
the end result will be just as ugly....

>Anyway..

Yes... <grin>

Cheers from Belgium
Dennis

Hi Djordje,

>>I think the thread turned into something different
>
>Indeed, it has drifted off-topic, but anyway...

It hasn't, but Frederic keeps changing the subject line to suit his needs,
the original thread was about GNU apps being better or just as good as the
commercial Atari apps... as far as I'm concerned, I'm still on topic.

Cheers from Belgium

Try this. Go into the section "News Reading Options" under
"Preferences". There should be an option for "collapse threads". This
should NOT be marked. The box next to it should not have an "X" in it.
When I tried it out and put an "X" in there, all replies disappeared.

Hello everybody,

my name is Juan and i am a new atari user. I have some problems with my new second hand Atari: i don't have disk drive and my question is: could i use a standard pc 720 disk drive? do i need some extra hardware?. My second problem is that i don't have any software: could i transfer atari software from the emulators? Is there some www or ftp site for download atari software?

A lot of thanks for all and Saludos desde Espa&#65533;a,

Juan

>I have used CAF in many enhanced resolutions, but never with a Nemesis.

Interesting. I had never heard that. But then if this is true, I
wouldn't be able to set the 800x600 resolution, because that
resolution is only possible with the nemesis set to "HIGH" or "LOW".

And I ran a little Nemesis accessory that tells you the current
[Nemesis] speed and resolution - and it still shows that it's active
once CAF loads.

I have noticed that CAF seems to be a little more stable with the
Nemesis set to "LOW" instead of "HIGH", although it could be my
imagination or just coincidence...

4417. Newsie problems

Newsgroup: comp.sys.atari.st
Date: 2002-05-18 22:07:57 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <ac6jbt$g90$1@reader1.panix.com>
Source record: 34768

For what little it may be worth, what happens with Newsie is that when its log files get bigger than 16148 bytes, they get written as used but unlinked clusters, and since the operating system does not know about these, they can "overfill" a drive, and cause data loss.

One solution is to delete log files, on a regular basis. There is one on what you did with it, and another that lists mail sent, and perhaps others.

Discus works for making real files out of lost clusters, so they can be deleted. The selection is under 'spezial'.

Before this, I used Zorg to find if I had a problem. For some reason, it complains about not having enough memory when it meets an unlinked cluster.

And, even using HHdriver, you can run ICD Cleanup, which is slower than Discus, by clicking on ICDBOOT, to relog drives, and then Cleanup works. Then, call up HDDriver again, and relog drives under it, and proceed. It is a long way around, but if you have ICD Pro Tools, and not Discus, it does the job. In either case, erase those new files with names you never saw before, found on the root of the drive that has Newsie in it.

There are of course several other solutions, but this one also works.

Isn't this a bug? You could have a multitude of files with the same name, if
you separate uppercase from lowercase. Must be a bug in some sorting algorithm
written in a hurry.

>The problwem is ST-ZIP (or other ZIP program used here) that sets filenames
>to upcase.

I agree that that is a problem if the files weren't named in uppercase, but
the filesystem is obviously also at fault.

I think there might have been some tutorials in some old ST mags
with example code for assembly. And it would need to be done in
assembly I think. Some demos used 64 colours. If you seen
Spectrum 512, it's very good!

> It's pretty small as well: around 27 Kbytes.

You need the GFA editor to run that. The GFA files are tokenized.
If it's a LST file you are after, you can grab the gfa2lst utility off my webpage and convert it to ASCII.

Hi,

Anyone remember this program?
Loaded Cad-3D files and rendered them in several ways.
Was it Phil Burgess who made this?
Anyone know what happened to him, how to get a hold of him?

I talked to the author ages ago on the old CodeHead BBS and he was
at the time working on an update to RezRender but it never appeared.

on some applications in low rez on the ST, they can display more than 16 colours at once, such as a graphics program showing the entire palette at once.. how is this done and why didnt anyone take it further? is there a huge strain on the machine to push it to far?

Spectrum512 lets you draw in all 512 colors in st low, and if I recall
correctly it used some 80% of the cpu time to maintain the display.
It was a rather cool app for it's time.

4427. More on Magxnet

Newsgroup: comp.sys.atari.st
Date: 2002-05-19 08:23:04 UTC
From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3ce76110e2ed40@madasafish.com>
Source record: 34648

Hi,

I have noticed something that may be causing some people problems when installing Magxnet. In the magx_rc.net file, you need a link to a drive with long file names for the Unix files, like this:

Where is your /etc path (please use a VFAT partition)
etc_path d:\etc

I noticed, that if I change my path to something other than d:\etc, like d:\network then some apps fail to resolve! The patched aFTP had problems with it this way. The only way I could use aFTP was to load it by going through the u: drive.

So, it seems for magxnet to function at it's best, call your folder as etc and make the link to that.

It is done by switching the pallet in the line blanking interval

As some one has pointer out spectrum 512 takes it further.

> is there a
> huge strain on the machine to push it to far?

I don't think it is that huge, its just it is very time critical.
You don't have long, so you probably need to mask off
other interupts, which means you can't run most normal
jobs whilst you are doing it.

That's great! Unicode support is the important thing CAB and all other
Atari browsers lacked (forcing sometimes to use weird techniques to
display pages properly)...

> Ralph Lowinski (aka AltF4) has made major improvements across a wide range
> of functions of HighWire, resulting in greater speed and stability. For his

There is one weird thing: with MagiC 6.2 and NVDI 5.03 on TT it says
"Hghwire needs SpeedoGDOS or NVDI >= 3!" and exits. I can start it only
with SingleTOS. I remember certain problems with the previous version
under MagiC (ie. it *sometimes* crashed the whole system when exiting).
:-(

I will try to deinstall anything else (leaving just MagiC and NVDI)
to check if it isn't caused by some other program running in background.

> As for ST-guide HYP files: I have no idea how to create them, besides I
> don't think that pages would load any faster as the amount of graphics
> would be the same.

It's similar to HTML, but easier (less commands) After preparing the
text (STG) file you move it to HCP.TTP and go for a long walk ;-)

I think HYP always work faster than HTML, because it takes time for
CAB to display the text itself and to display the graphics (convert
them from GIF format etc.) ST-Guide displays text immediately, and
displays images (in IMG format) faster than CAB displays GIFs...

Hello Andreas,

Don't worry, I'm not dead yet. There is a saying, I don't remember how it goes but It says something like their is nothing surer than Death & Taxes. In my case, I added Moving, because no matter how hard I tried to stay with my old Internet Service Provider, it wouldn't work. This after I spent over 360 Dollars over 2 Months Calling a Long Distance number that was still compatible with my Atari. Over that 2 Months I was trying to Get Cab and get it set up so I could still use my old ISP. I was about to get CAB up and working so I could call Pacifier locally again, but then Pacifier finally told me about a Protocol that My Atari and CAB doesn't support. In other words, I wasted 360 Dollars and 2 Month's when what I should of done is move to another Internet Service Provider. In other words, nothing's surer than Death, Taxes and Moving sale. By the way, Andreas. I haven't heard from you in a while. I hope everythings going well.

Indeed. Spectrum 512 changes half the palette four times on each scanline.

> I don't think it is that huge, its just it is very time critical.

If you only change the palette on each HBL the overhead is actually quite
small, but the way Spectrum does it requires very exact timing so you need
to fill the timeslots between the palette changes with NOPs or something
useful (but only to Spectrum ofcourse). You can't return from the HBL
interrupt until the last palette change on each line, which leaves only
20% CPU or so for other tasks.

Hello Greg,

There is a program that goes with Highwire called FontList. Run this
program. It will list all Speedo Fonts you have installed. I would
imagine that your problem is that you do not have any installed.
Highwire does not use TrueType and other fonts as yet.

I have tried it and it looks nice. It's an almost exact copy of the PG800 programmer for the Roland JX8P. I modified one or two lines in the sourcecode. (In my version you will see the current directory if you open the fileselector, instead of C:\.) I have also added a compiled ready-to-use jxeditor.prg to the archive. This archive can be downloaded from here:
http://www.home.zonnet.nl/m.tarenskeen/jxeditor.zip

It's not my intention to keep it there forever. Is anyone willing to adopt it to put it somewhere permanently (Tim (TAMW), are reading this ?)

I just tried the unicode demo html file. Never even knew so many different character varieties are possible with html :)

I also like the new possibility to scroll pages using the keyboard arrow buttons. This works great, very fast scrolling. The window scrolling using mouse and window slider/arrows is a totally different story. No real time scrolling using the mouse. I hope it is on the TODO list and will be added soon. A reasonable wish in this stage of development, I would say.

I have quite a big number of Speedo fonts installed, together with
TrueType ones. I started FontList, assigned Life, Gothic 720 and
Courier 10 Pitch to Highwire "normal", "header" and "teletype",
but it still complains that I have no NVDI/SpedoGDOS. FontList
does not have this problem, it lists all my fonts (including the
TrueType ones which are grayed out, and Speedo which are accessible).
And both NVDI and FSMC cookies are present.

>Licence carefully you'll find that too.

This'll import IMG files...

http://registry.gimp.org/file/img_0.1.2.c.gz?action=download&id=139

```
cd [gimpdir]/plug-ins
mkdir img
cd img
[copy sourcefile here]
gimptool --build img_0.1.2.c
```

It'll probably fail, so add the define commented below...

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <gtk/gtk.h>
/*~~~*/
#define GIMP_ENABLE_COMPAT_CRUFT
/*~~~*/
#include <libgimp/gimp.h>
```

Now it'll work...

```
gimptool --install img_0.1.2.c
```

...should end up in ~/.[gimpdir]/plugins

Seems to work with colour too. ;-)

When RASN was caled Crazysounds there was a sounds
that imitated a 'classical' bell sound connected to
the return handle as in old typewriters. I haven't
found the similar one in RASN. Does anyone know where
you can get the older soundfiles from Crazysound?

Thanks,

Raoul Teulings

No problems here. I downloaded it from
http://highwire.atari-users.net/download.htm

Version .02 .03 and .04 are all there, and so is Fontlist 1.11.

Try again.

You are right, I forgot it completely because I fixed it in my
installation several years ago.

Standard Nemesis has one bad "feature": any MIDI application turns it from
"HI" to "LO" mode. It means if you have, say, 800x600 at 75Hz in "HI" mode
(48 or 50MHz videoclock) and you run Cubase, then nemesis falls from "HI" to
"LO" mode and videoclock too => resolution is still 800x600, but refresh
rate is about 60Hz, plus picture timing is messed and might be out of range
of your monitor.

Best Regards,

Ctirad

That does make sense, and would explain why the original 2 color
resolution I had set with Videlity (which I think was 896x672) would
be reset to the Falcon's standard 2 color resolution once CAF loaded,
because this resolution would only work with the Nemesis on HIGH,
not LOW or OFF. And since CAF kicked the Nemesis down to LOW, no
more high resolution!

Now, with 800x600 as my 2 color resolution, it's not a problem, since
this can be achieved with the Nemesis set at HIGH or LOW. And I've
made adjustments to my monitor, so the display fits well on the screen
without any glitches or problems.

Interestingly, the Nemesis accessory still reports that the Nemesis is
running HIGH though.

Anyway, thanks for clearing things up guys.

Hi Oracle,

>where can i download this program to see it ?

Hmm, it may have been commercial but I had Spectrum 512, I think
it might have been a demo. I just checked my cover disks and
it's ST Format , not sure what issue though. When I bought my
ST it came with a few cover disks but no magazines. Oh, it's
complete copy actually. Also has code for using 512 colours in
STOS!

Shall I copy it and put it somewhere?

A couple of thoughts/suggestions:

1. Depending on how much business you think you might have, you might be able to use just a personal account on PayPal.

2. Some customers may be willing to pay a service fee for PayPal use. In the US, there ARE extra mailing fees for registered mail, insurance, etc.

3. PayPal would allow you to accept credit card payments. A lot of people may prefer this as a safety precaution if they fear the product may be defective, lost in the mail, etc. They simply may just feel better doing it this way.

Ken

It's possible that Sounddiver doesn't use pure SysEx format for
storing/sending data, but - depending on the driver for the specific
synths - uses it's own format.

A program that could be useful for you is mex2mid, which can be found on
my website (http://home.zonnet.nl/m.tarenskeen/mex2mid.zip). With this
program you can load a MID file containing SysEx data, and save these
sysex data in SysEx format. (.SYX, .MEX, or whatever extension you prefer)
The name of the program suggests it also works the other way around. And
it does :)

In what way do your Sysex MID files work different than normal songfiles ?
Do they work differently, or don't they work at all ?

Another point: some (very) old synths have a very weird SysEx
implementation, very difficult to handle for "universal"
editors/bankloaders. The Casio CZ series are the most horrible example of
this. Despite that there are Atari ST programs that can handle these
synths (including Soundiver if I remember correctly)

I'm still trying to get UNI_MAN released as freeware. The main advantage
of this universal sysex tool is that it still has an active Atarian to
support it: that's me (http://uniman.atari.org)

Martin Tarenskeen :-)

> And both NVDI and FSMC cookies are present.

I have found out that HW4 does *not* recognise NVDI only when the
"Kompatibilitat" option in NVDI Kompatibilitat CPX module is switched
on. When I switched it *off*, HW4 recognised NVDI properly.

So now I could start it without problems with my usual setup and I must
say I am impressed! Polish characters are displayed correctly ;) and
a lot of problems with HTML rendering that the previous version had
are now fixed. Some stayed, though, especially problems with
tag which almost always makes HW crash, certain things with

cells widths etc. It also seems HW4 still does not support
tag...

I tried opening some Hebrew documents (UTF-8, ISO 8859-8) - although
I quickly realised HW4 does not support UTF-8 encoding yet, the Unicode
support makes me look into the future with much hope ;-))

So keep up your great work! This will be surely the best piece
of software released for Atari platform (when finished). But please
take a closer look at the way HW recognises NVDI presence... ;-)))

Well, I was interested in that, thanks for the report. I've become
real comfortable working with CAF. Of course, I am pushing 42! Old
dog, new tricks?

> Nemesis accelerator. However, turning this completely OFF does not
> seem to improve the situation either.
>
> I'm stumped.

I still have my Nemisis Falcon, and 3 of my CD's were done on it. I
did however never use it in the "High" mode. I would get little
artifacts on the screen, then as the machine heated up, I'd get
crashes. Of course, I did the installation myself, so I was probly
lucky it worked at all. ;-) I also installed the CT030 in my other
Falcon, and had about 1 1/2 years of problems. It was only solved by
sending it to R. Cuzba in France. Upon seeing it his email to me said
something like "When I looked at you mother board I had a vision of
horror! Who did your installation? The solders looked like big turds!"

It did'nt bruise my ego too much! :-)

I noticed from another post about the screen resolution that you might be dealing with that stuff too. Have you tried working in just "low," and has that changed anything?

Wayne.

It sounds like you downloaded the Source Code archive. There is a
binary
only archive as well. The program wasn't included in the source archive to
keep
size down for people with slow internet connections.

UTF-8 is supposed to be supported. But I'm not necessarily the best person
to
discuss that one. Rainer did the work on that. I don't believe ISO8859-8
is supported

at the moment. So potentially there is a problem there. I know that Hebrew characters
can be displayed with the new code.

>

>

Hi Hallvard,

I have looked into it and this is what I have found:

- The JXEDITOR is made for the JX8P, but I did not find the authors name somewhere.
- The program sends midi data using Midi Channel 15 (Pretty weird, I know)
- The JX8P implementation doesn't support any dump request messages. If you click on "get tone" in the programs editor screen, the program will simply wait for tonedata to arrive. To make the JX8P send these data, select a (different) tone on the JX8P.
- In the "bank" window you send a tone to the JX8P using the left mouse button, and you import this tone into the editor screen with the right mouse button. After that the tone in the JXEDITOR and in the JX8P should be the same.
- Check if midi/sysex is enabled. I remember a little switch on the back of the JX8P (?)

Did you ever try the JX8P midimanager file that exist for Cubase with the
MKS-70 ?

Does the PG-800 use the midi port (like the programmer for the Juno-1/2)
or does it have a special port (like the PG300 for the JX3P) ?

Does anyone feel this is off-Atari-topic ? We're just trying to make an
Atari program work :)

4470. German help for xbios5

Newsgroup: comp.sys.atari.st
Date: 2002-05-20 20:05:26 UTC
From: yves.rogne@free.fr
Message-ID: <3ce95705$0$241$626a54ce@news.free.fr>
Source record: 34672

Hello,

Xbios 5 don't work the same for graphic cards and for standard Ataris. I got the German infos but thats too hard for my German school level. Can anyone help me in translating or explaning this :
Die Vorgehensweise ist dabei folgende:

Die NOVA unterst�tzt mehrere Bildschirmseiten. Diese liegen alle im von der Grafikkarte zur Verf�gung gestellten Adressraum. Zum Umschalten auf eine andere Bildschirmseite wird wie gehabt die XBIOS-Funktion 5 "Set Screen" benutzt. Die Anzahl Bildschirmseiten kann aus der NOVA Control Block (ICB) Variable scrn_cnt (sprich: "screen count"), erfahren werden. Daneben gibt es noch die ICB-Variable scrn_sze, die die Gr��e eines Bildschirms in Bytes angibt. Die Variable base gibt die Adresse der Bildschirmseite 0 an.

Wollen Sie also physikalisch auf die Seite 1 umschalten, so geschieht das einfach mit dem Aufruf (unter der Voraussetzung, da� icb ein Zeiger auf den NOVA Control Block darstellt):

```
Setscreen((void *)-1, icb->base+icb->scrn_sze, -1);
```

Noch etwas:

Wie Sie vielleicht wissen, kann mit der Funktion (*icb->p_chres)() die Aufl�sung der Graphikkarte umgeschaltet werden. Dieser Aufruf ver�ndert aber nicht die physikalische Bildschirmadresse. Daher sollte immer zuvor
ein
Setscreen(icb->base, icb->base, -1);

erfolgen, um die physikalische und logische Bildschirmadresse auf Seite 0 umzuschalten.

Mit der Funktion (*set_vec)() (Achtung: im Supervisormodus aufrufen) wird der VDI-Ausgaberoutinen auf die aktuell eingestellte Aufl�sung umgestellt. Dabei wird immer implizit physikalisch und logisch auf die Bildschirmseite 0 geschalten.

If you read the docs for HCP and ST-Guide, you will find out how
to create them with a text editor. Mainly a question of putting
'@node' at the start of each page followed by its name in
double-quotes, and '@endnode' at the end of the page. Links are
created automatically to the named page if the nodename appears in
the text, or you can set explicit links where required.

Even better, use UDO with a fairly similar syntax which can then
produce HTML, HYP and even plain TXT files from the same source!

Having produced some large HYPs, I disagree with the second
statement: They do load a lot faster than HTMLs in CAB, specially
if you use mono images. You can also use 16-color IFFs should you
really need colour. A big advantage of ST-Guide is that it
normally runs as an ACC, so you can open it from within another
programs etc. even if you don't have a multi-tasking OS.

Hello,

I have created some SYX files for use with a Roland MT-32. I used a
program called Midi-EX I believe. Worked real good. I am not sure if
the program was just for the MT-32 or what. Been a long time since I
did that sort of thing. Oh BTW, the SYS files worked just fine.

>CAB to display the text itself and to display the graphics (convert
>them from GIF format etc.) ST-Guide displays text immediately, and
>displays images (in IMG format) faster than CAB displays GIFs...

I agree, it is a lot faster, specially on slower machines like
those running TOS 2.06. The main reason is that text does not have
to be reformatted - HYPs are compressed files (by HCP) that unpack
and display in ST-Guide with the current system font. It is up to
the author to make sure that the line length is correct for a
standard ST screen - about 72-75 characters. Not quite as
straightforward as it seems, because any commands (such as text
styles, explicit links, ignores etc.) do not count for display but
of course add to the character count in the editor in which you
are writing them :-)

For images you have the choice of IMG or 2- or 16-colour IFFs. In
most cases I have been able to reduce screen shots to this with
Imagecopy: Grab the images in the native resolution, then change
the screen resolution and either use the convert function, or
just screen-grab them again in the new colour depth. Haven't tried
16-colour XIMG.

And as I have said, once you learn UDO (and I haven't!) you can
produce HTML, STG and even plain text from the same source file!
(As I am fairly familiar with STG, I write in it directly, but
then I don't need any other type of output; actually HCP will
produce a plain ASCII file from the HYP on request.)

Regards, /Peter/

No problemo!

The procedure for this is as follows:

NOVA supports multiple screen pages. These all lie in address space made available by the graphics card. For switching to a different screen page the XBIOS function 5 "Set screen" is used as usual. The number of screen pages can be ascertained from the NOVA control block (ICB) variable scrn_cnt (pronounced "screen count"). Besides this there is also the ICB variable scrn_sze that gives the size of the screen in bytes. The variable base specifies the address of screen page 0.

So if you want to switch physically to page 1, then this can be done simply with the call (on the understanding that icb represents a pointer to the NOVA control block):

```
Setscreen((void *)-1, icb->base+icb->scrn_sze, -1);
```

Something else:

As you may know, you can switch the resolution of the graphics card with the function (*icb->p_chres)(). But this call does not alter the physical screen address. Therefore you should always use

```
Setscreen(icb->base, icb->base, -1);
```

beforehand to switch the physical and logical screen address to page 0.

With the function (*set_vec)() (Attention: Call in supervisor mode!) the VDI output routine is converted to the currently set resolution. During this it will always implicitly switch physically and logically to screen page 0.

Regards, /Peter/

Audio Tracker has some nice features, is fast, and looks good. But some elements of the interface/design are extremely un-intuitive, overly-complicated, and just plain dumb. I really _tried_ to like it, and adapt to it's way of working, but it's just not going to happen.

On the good side, it's given me a new appreciation of certain features of CAF...

...but if CAF continues to give me too much crashing trouble, it'll be time to build a second PC and run ProTools for multitracking audio (keeping the Falcon next to it for all my MIDI work of course).

>It did'nt bruise my ego too much! :-)

Ha! Well, Alex of ATY Computer in Oakland, California did my Nemesis install. I don't think there's anything wrong with it, as it's never given me trouble that I could tell, and it's almost _always_ running in HIGH mode when I use the Falcon for anything (under TOS and MagiC).

>I noticed from another post about the screen resolution that you might
>be dealing with that stuff too. Have you tried working in just "low,"
>and has that changed anything?

Actually, after doing more testing, and resolving the resolution dilemma, I have noticed that CAF seems to work better with the Nemesis in LOW mode. More thorough testing will come in the next week or two as I'm going to be doing lot's of vocal recording for some of my new

material / projects...

Sixth annual Atari Jaguar Festival to be held Downtown St. Louis

For immediate Release:

April 16, 2002

Greg George webmaster of The Atari Times, James Garvin of OMC Games and Daniel Iacovelli Chairperson of The Atari Video Club/Jaguar Community United has agreed to host the Sixth Annual Atari Jaguar Festival (dubbed Jagfest 2k2) in downtown St. Louis, Missouri at The Mayfair Wyndham Historic Hotel. (806 St. Charles Street St. Louis, Missouri 63101. Phone: 314-421-2500.) For the first time this event will be held on two days instead of one, Friday, July 12th and Saturday, July 13th 2002.

The scheduled time for the event is 10am to 6pm on the first day and 10am to 4pm on the second day (a full schedule of events will be announced in the days to come).

Admission cost for this event is $25.00 for those who wish to pre-pay and $30.00 for those who wish pay at the door; this cost covers for both days. At this time table prices are estimated to be: Visitor tables: $40.00 Dealer Tables: $50.00 (extra tables are $5.00 each) (Table Fees are subject to change)

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com or Daniel Iacovelli at atarivideoclub@yahoo.com or visit the Jagfest 2002 site at http://omcgames.com/jagfest/
(be sure to visit the Jag fest
message board and post your ideas for this event.)

END PRESS RELEASE

Now accepting payment for Jagfest 2002

For Immediate Release:

April 25, 2002

Greg George, Webmaster of The Atari Times website, has announced that he is now accepting payment for the Sixth Annual Atari Jaguar Festival (dubbed Jagfest 2k2) in downtown St. Louis, Missouri at The Mayfair Wyndham Historic Hotel. (806 St. Charles Street St. Louis, Missouri 63101. Phone: 314-421-2500) on Friday, July 12th and Saturday, July 13th 2002.

Admission cost for this event is $25.00 for those who wish to pre- pay and $30.00 for those who wish pay at the door; this cost covers for both days. Table prices are as follows (admission price is included): Visitor tables:

$35.00 before July 9th (after July 9th its $40.00), Dealer Tables: $45.00 before July 9th (after July 9th its $50.00) (extra tables are $5.00 each). You can pay either by paypal (greg@ataritimes.com) or by sending a Check or Money Order to Gregoary D. George, 347 Banyan Drive, Winter Haven, FL 33884 Attn. Jagfest payments

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com or Daniel Iacovelli at atarivideoclub@yahoo.com or visit the Jagfest 2002 site at http://omcgames.com/jagfest/jf2k2.html (be sure to visit the Jag fest message board and post your ideas for this event.)

Hi Martin

I did indeed read it, and now I have put it (with credits of course)
on the Atari-MIDI archive here:

http://groups.yahoo.com/group/atari-midi-archives/files/SOUNDS/Roland/

This dir is linked to my download page on my site as well.

There is also some other Roland stuff there including 100 sounds for
the JX by David Etheridge.

Thank you for your compiling work

4490. Eagle Sonic softwares

Newsgroup: comp.sys.atari.st
Date: 2002-05-21 09:15:38 UTC
From: Pierre TONTHAT <ptonthat@aamass.com>
Message-ID: <acd39s$1ae$1@wanadoo.fr>
Source record: 34694

Bonjour :)

I have got a Falcon with a rare accelerator card (at least in France). It's called "Eagle Sonic" and it's a small board that jumps on the 030 bus extension. On the card is solded upside-down a real 68030 (XC68030RC50 (don't remember the letters very well)).

I have found on the hard disk the MHZ32.PRG that seems to activate the acceleration with this new 030. The acceleration is not fast (+ 40%), but it's good to find some oddities/oldies about Falcon adds-on.

But my problem is that the disk that should contain the drivers and others softwares is unreadable.

So is there more files for the Eagle Sonic than the MHZ32.PRG ? And if yes, where can I get them ?
Other question : I have read that the DSP was disabled during the acceleration, is that true ?

I have searched on the web/usenet... but no results. I have also heard of the Mighty Sonic that seemed to be a sort of CT2 with VME bus (1993/1994). Does anyone have a photo about this stuff ??? Or was it a vaporware ?

Thanks

Pierre
http://rajah.atari.org

PS : also inside the Falcon was a memory card called "Falcon Wings" from H&N that expanded the RAM to 16 MO (4*4Mo SIMM).

> 20% CPU or so for other tasks.

For what I remember, Spectrum 512 is not HBL based, it's VBL based.
At the begining of the screen the program synchronize itself with the
video counter with a code that look like this:

Vbl
; save registers
movem.l d0/d1/a0/a1,-(sp)

;
; Synchronise
;
moveq #0,d0
wait_sync
move.b $ffff8209.w,d0 ; or is it 820a ??? Don' remember :)
beq.s wait_sync

moveq #32,d1 ; A SHIFT operation is at most 32
subq.l d0,d1 ; subtract counter value, in order to get an inverse
timing
lsl d1,d0 ; shift d0 by d1. Each shift takes 2 more clock cycles

;
; Display colors
; (note that for Spectrum, $ffff8240 stay black, to avoid
; color problems in the borders), so only 15 colors are
; changed each line
;
lea colors,a0 ; pointer on colors
lea $ffff8240.w,a1 ; pointer on shifter clut registers
```

```
move #200,d0
loop_scanline
; first change
move.w (a0)+,2(a1)
move.w (a0)+,4(a1)
move.w (a0)+,8(a1)
move.w (a0)+,10(a1)
move.w (a0)+,12(a1)
move.w (a0)+,14(a1)
...
move.w (a0)+,30(a1)

; second change
move.w (a0)+,2(a1)
move.w (a0)+,4(a1)
move.w (a0)+,8(a1)
move.w (a0)+,10(a1)
move.w (a0)+,12(a1)
move.w (a0)+,14(a1)
...
move.w (a0)+,30(a1)

; third change
move.w (a0)+,2(a1)
move.w (a0)+,4(a1)
move.w (a0)+,8(a1)
move.w (a0)+,10(a1)
move.w (a0)+,12(a1)
move.w (a0)+,14(a1)
...
move.w (a0)+,30(a1)

; few nops here ?
dbra d0,loop_scanline

; return from exception
; restore registers
;
movem.l (sp)+,d0/d1/a0/a1
rte
```

Ok I type all that stuff from memory, so there are certainly some errors here and there (the first one being that the synchro is done with a NOP jump table instead of the LSL trick... that do not work on 68030 processor that do all the shift in the same timing due to the barrel shifter, but the whole stuff cannot work on a 68030 anyway :))

Among the improvements that could have been done to this code, most are false good ideas.

The first obvious thing was to replace the

move.w (a0)+,x(a1)

by

move.w (a0)+,(a1)+

sequences that are faster, but the problem became that
you need to reinitialize a1 register to the value $ff8242
between each sequence, so it make the color computation
more difficult because the color change timings are no more
identical. Same thing if you want to use "movem", or "move.l"
it's faster, but instead of having this kind of timing:

. . . . . .

you get something like this:

....

Anyway, a good idea for someone that would like to recreate
a STE only version of Spectrum 512 would be to use the blitter
to do the whole operation. With the right settings it's possible
to perform the whole operation in only one blitter call, having
the fastest and most regular color change. Considering the 4096
color palette, and the fact you can also alternate between two
pictures to produce more colors, it's possible to reach near
true color quality on a STE.

Mickael Pointier (aka Dbug/NeXT)

!!! NEW VERSION AVAILABLE NOW !!!
I have made some simple and obvious changes to the program:
- Freely selectable MIDI channel
- You can choose between JX8P or MKS-70 (Might work with JX-10 too, but I remember the JX10 having a very poor SysEx implementation so I'm not so sure about that).
- With the MKS-70 you can choose between Tone A and Tone B. I believe A is the same as "Upper Tone" and B is "Lower Tone". Let me know.
- I have added a (very) little readme.txt to the archive.

For what synths/devices do you have problematic files ? I have some experience in converting problematic files into useable ones. I have a large collection of SysEX data sheets, UNI_MAN comes with a set of tools for viewing, converting, and managing SysEX files, and I have done some succesful hacking and (gfa) programming with SysEx files for my personal needs in the past. Write to my personal e-mail address, I might be able to help.

well, as far as I can understand, there would be max. 4 or 5 address reinitializations per line, thus using the a1, a2, ... registers as a destination would remove the problem. They just would have to be reinitialized all at once in the beginning of each scanline.

François.

Yep, sounds like a good idea.

There are some other color change scheme that have never been tested,
like using only 8 color entries for the background picture, but using
the same kind of color tricks for getting more colors, and using the
8 other entries for foreground elements, and trying to make a game
with that. Using the STE hardware scroller capabilities, I suppose a
kind of true color pinball game could be done. The remaining 20% of
CPU time could be used to display the ball sprite and dynamics...

I don't have the Atari board laying aroud anymore, I sold it. However
it would except 1mb simms or 4mb simms only. Thus you could configure
it for 4mb or 16mb total. I do not have the jumper settings, sorry.
That is if it's an Atari made board.

Cool! Is that a mass produced silver CD or home burned CD-R?
I'm asking because I had problems with home burned disks before and
I didn't see this info on the page. I'd like to know this before I order.

I have a Mighty Sonic 32, basically the same as what you have except
for 8 simm banks for 30 pin simms (32mb memory max). The alternate ram
really speeds up the Falcon. I run mine with a Nimesis at 42Mhz. I
don't think there are anyother applications for the Eagle Sonic you
need except for the MHZ32.PRG. The other application installs the
alternate ram. If you download and register DoItF030, you will find a
copy of the Mighty Sonic Manual there as well as photos.

That sounds like a pretty good collection. Especially since the space user group is one of the few still active to any degree. The TAF pd/shareware library will be ready a bit later this year as well, soon as the 8bit collection is pacakaged and trasnferred over. The best thing about these user group libraries is that most of them quite often have some unique bits of software in them that doesn't often make it onto the ftp servers.

The first problem is that I'm not the author of UNI_MAN, nor am I the distributor. I am "just" the one who created most of the "device adaptors" for many, many synths and other Midi equipment. And I still create new adaptors once in a while, and am maintainer of the UNI_MANiacs website.

Another problem is that the program is copy-protected with a method that uses the original master floppydisk as copy-protect key. A very irritating method, and risky too: If anything happens to my original floppy, I will not be able to use my UNI_MAN anymore.

If UNI_MAN is released as freeware, the copy-protection routines have to be removed in the source code. The current protected version is not suitable to be released as freeware on the internet.

It's all in the hands of Zadok, the original distributor. All I can do is send him some e-mails and phonecalls once in a while.

I used to use STOS a lot (and I mean a lot), although I had many of the
extensions that really make it fast, the manual is a real must. Mine is
looking very sorry for its self.

I would also recommend getting the compiler to increase the speed of your
progs by ten fold, as for extensions;

I forget the name (the one that came with lots of demos, hmm, fast screen
copy routines and sound playing things), really good.
STE/Blitter is good for testing, then convert them to pokes.
TOME can be good for quick programs like map design that do not need speed.
There was a GEM interface extension but never used it.

I think there were many others later on that I never used, such as Falcon.

In fact, anyone know of a complete list of extensions and how good they are?

Elliot...

>

I have had similar situations where the program didn't start, exiting with a tos error -33 (File not found). I also found that the fonts were needed, but not used when using NVDI. I only discovered yesterday what they should look like on screen: I nearly always have NVDI installed.

Anyway, I have fixed the problem radically. These fonts are not needed anymore. Also reduces the size of the program and sourcecode quite a lot.

The fixed version can be found on the same old location:

http://www.home.zonnet.nl/m.tarenskeen/jxeditor.zip

If there are any problems with this new version, let me know.

I believe you were thinking of the Missing Link extension. There are
probably more extensions than those I have listed below (do a web
search), but in my experiance they all tended to offer the same kind
of commands. Although some extensions may have executed then better
than others.

Official Extensions.
3D
Create and move 3D objects in 3D space - not bad once you get used to
it however the complexity of the objects and the colours you can use
on them is limited.
MAESTRO
Add and playback Sampled sounds - I do not know how good this is as I
have not used it .
SPRITES 600
Not actually an extension, just a collection of sprite nor are there

600, 600 images maybe be they only allow you to animate 15 or 20 sprites - Not really worth getting.
COMPILER
Personally I would consider this an essential if you want anyone other than fellow STOS owners to be able to run your programs and I dont understand the reason for making it a sepperatly packaged extension - easy to use and essential if you want as many Atarians as possible to have access to your programs.

Third Party (user) Extensions
MISSING LINK - by Top Notch?
I believe that the Misty extension was an early version of this one, and that this is the one most users appeared to prefere - as many Stossers used this extension I suppose it must be good although for some reason did not like it much, this may have had something to do with the fact that it did not really have any functions I wanted as that were not already available in the Extra extension, also as I recall it interfered with the Extra extension.
EXTRA - by Martin Cubitt (aka Sinbad)
Commands for Disk formatting/copying, finding TOS/GEM versions, amount of installed Memory, Image/Screen Compacting/Expanding and Partial loading of files among other things - not bad although as with all things its usefulness depends on if it has the features you require, I mostly use the TOS function to find what type of machine (ST/TT/Falcon) the user is trying to run the sofware on.
BETA 2 - by Anthony Jacques
This is more of an upgrade than an extension as it included a newer version of the STOS loader (STOS207.PRG) that had been patched to work with most TOS versions, it also includes TOS patches for the Compiler that "fixes" compiled programs during the compilation stage so that they will run with various TOS version, essentially providing the same function as his eariler STOS fix program but in a more user friendly and useable way - useful though possibly not essential if your only programming for yourself.
FALCON - by Anthony Jacques
Graphic, Sound and JagPad commands for the Falcon - it looks quite useful although I have only played with it from the point of getting STOS programs written for the ST to also run on the Falcon, thus making them available to more people although a problem with the compiler extension is currently preventing compiled programs from running on ST's, Doh!.

I personally found that having all the avaiable exensions installed was messy, unnecessary as most of them provided the same range of functions and imposible if you don't own a Hard Drive, also some appeared to interfere with others, beware of different extension using commands with the same name!.

I'm looking for such items (4mb SIMMs).
Would you mind selling me 4 ?
And, for your problem, it depends on the board you own.
More at http://fishpool.fi/~q-funk/TT030/tt-ram.html
I was given this link yesterday, as an answer to my post.
Learnt much thanks to this.

I have the original atari ram board part number: CA400312

apon closer inspection, the ram is soldered straight on the board, no sockets at all

I also have 3 x 3 pin jumpers marked w1, w2 & w3

I hope someone can tell me for sure if i can desolder these and put sockets on...

Ps, I'm in australia, i dont think the ram would survive traveling that far :)

thanks

Jean-Luc,

I've never seen an Atari TT RAM expansion board (I have a GE Soft in mine) so I do not know if the following instructions physically match the layout of the board you have.

Based on the following instructions, it may be you can only have 4 - 1 meg SIMMs or 4 - 4 meg SIMMs:

****

With the board placed in the TT and looking at it from the front, there are two rows of jumpers. There are 5 on the bottom and 1 on the top.

From this perspective each jumper can have 2 settings. Either on the lower 2 pins (D) or the upper 2 pins (U). (Lower is closer to the front of the TT.)

4 Meg Settings:

Top Row: U
Bottom Row: U,U,U,U,D

16 Meg settings:

Top Row: D
Bottom Row: D,D,U,U,D

****

This info was originally posted on GEnie (for those that remember it) in May, 1996 by Roger Burrows of Anodyne Software. Neither he, nor I, can vouch for the accuracy.

Use these instructions at your own risk.

Good luck.

Ken

>on...
The whole process is thoroughly explained in the document the link
points at. According to it, in addition to desoldering the RAM and
soldering sockets instead, you have to add a resistor and do some
extra wiring. The most difficult IMO would be to unsolder the RAM
without damaging the board...

>Ps, I'm in australia, i dont think the ram would survive traveling that far

It isn't a bug or a limitation. It's a feature. This way you can easily see the thread. This doesn't bother me at all.
The first posting in a thread is listed fully. e.g. Weird Okami (or Re: Weird Okami if the original posting lacks)
All the replies to this message will be showed as: >

On thing puzzle me though. I can't understand why you get sometimes a " sign.
On my setup I see something like this:
Oracle TT ram board

>Ghostscript (free) and Porthos (commercial) will both read PDF
>files (with varying success, it must be said).

Porthos can be found here:

<http://www.dsd.net/prod/atari/porthos.php>

Unfortunatelly the manual is only in German, but You can change the language the programme uses to German, English, Netherlands, Czech, Italian or Swedish.

From the above mentioned link You can download a demo version which is able to print the first page of each pdf document - enough for having a first look, I think. :-)

The most actual version on the above mentioned page is 1.28, but there's a good further development. I'm a registered user and beta tester for that software. I now use version 2.00 dated 31.01.2002, which has a lot of improvements compared to version 1.28.

The advantages compared to Ghostscript for Atari:

- much faster
- uses GEM user interface
- recognizes and uses FPU, if available
- has a very good support by the author - doesn't matter if You're registered or not

(Maybe) disadvantages:
- needs at least NVDI 5
- needs mulitasking os
- needs WDIALOG or at least MagiC 3.0

Ciao, Eick

I think the Phoenix/Xenomorph package came with some FLH utilites. The
author of Mountain also released some FLH/I/C utilites as well. Search
out Mountain Software, and on the utility page, you should find the
softs.

Yup! STOS went through the usual extension craze, where lots of people
where doing there own extensions. Very few were unique, like 3D and
maestro, many incorporated other extensions into one package.

Yep, thanks. The download links had disappeared from that page when I checked last.

>The advantages compared to Ghostscript for Atari:

With apologies to the author, it isn't a patch on Acrobat. But it does knock spots off Ghostscript for the reasons you list.

I do find the font that it uses for screen display is very hard to read though, is there any reason why it cannot use the correct PS fonts like GS can?

Cheers

Derryck

4541. Odd Falcon Floppy DMA/HD Driver

Newsgroup: comp.sys.atari.st
Date: 2002-05-23 17:28:10 UTC
From: rustynutt@hotmail.com
Message-ID: <fc53daf3.0205230928.bd5321a@posting.google.com>
Source record: 34744

Short and sweet.
I have been trying to get a SCSILINK Ethernet adapter setup on my Falcon, but seem to have DMA problems with the STinG scsilink.stx driver installed. HD Driver (Uwe, you may not have the info, purchased through Systems for Tomorrow, and the defunct place out of England) is controlling the device at bootup, the driver loads ok when STinG loads from the autofolder, the CPX reports it installed. However, the floppy drive fails with the driver active. Removing the scsilink.stx driver (and leaving the device attached to the SCSI bus) everything is back to normal. I've disabled the fastram and caches on the Afterburner hoping to elimate DMA problems as well. I have extensively tested the SCSI bus using Kobold and TreeCheck with megs and megs of data and no errors reported.

Afterburner, alternate ram disabled, caches disabled
Tried DMA snoop (AB utility) in autofolder.
Just running TOS, haven't tested MiNT yet.

Roger is looking into this, but was wondering about the hardware side of the problem.

TIA,
Mike

Hi Erick, and All,

I D/L Porthos, it sounds like a very nice program but will not run on
my TT30 as it is looking for NVDI-5 and I run NVDI 4.10. I have NVDI-5
but never got it working right on my system, so I went back to 4.10,
when time permits I'll give 5 another go.:)

Thanks, Donner.....

I don't need to change it, because as I know now that > means "the
same subject as above" it doesn't annoy me any more ;-))

But is there any way to make Okami display the threads in a way
Newsie (or Netscape Messenger...) does? I.e. sort the messages
according to the _thread_, not date or subject?

4549. FS Expose Video Digitiser (UK)

Newsgroup: comp.sys.atari.st
Date: 2002-05-24 08:28:19 UTC
From: mathman242000@yahoo.com
Message-ID: <59f561e5.0205240028.15c58349@posting.google.com>
Source record: 34603

For sale Expose Video Digitiser

The ultimate video digitiser for the Falcon. Fits
on to the internal expansion adapter. The unit
fits inside the standard Falcon case, and has a
remote RGB Splitter pod. Email me for pictures.

Works in any resolution (including TrueColour).

Typical transfer rates on a standard Falcon

128x80 25fps
256x160 17fps
512x256 6fps

Features composite video and S-Video input. Colour,
Contrast and Brightness controls on the RGB splitter.

Fully functional the package includes

*Expose Digitiser PCB (fits inside Falcon)
*RGB Splitter Pod
*Expose Manual (installation and use)
*FalCUBE and FalCAM disk (lets you view
video input in realtime)

The Expose is compatible with various software
packages including Apex Media (not supplied).

You will need a standard 12v DC PSU with a
2.1mm plug to power the RGB splitter. This can
be supplied if required.

*Expose 75ukp
*PSU 10ukp

Post and packing extra.

Contact mathman242000 [AT] yahoo [DOT] com

Pictures of the unit are available.

Seems the poster is from the States, so that shouldn't be a problem.

However, I would seriously reccomend Dell for reliability, price, and an
excellent warranty service.

Or, alternatively, buy a ST book (if you can find one...)

Simon

4552. FS: Recased STFM with PAK/30 and more!

Newsgroup: comp.sys.atari.st
Date: 2002-05-24 11:54:56 UTC
From: Carby <techsupport@spamnews.dsl.pipex.com>
Message-ID: <3cee29f5$0$238$cc9e4d1f@news.dial.pipex.com>
Source record: 34604

For sale: STFM recased in a quality Lighthouse Tower case.

Powered by a 25MHz 68030 PAK/30 board, FRAKK/2 board with 16mb TT ram, PANTHER ISA adapter driving an ET4000 SVGA card.

4mb ST ram upgrade.

230mb Hard drive

1.44 floppy with the HD modification (needs repairing, wire come loose)

Will come with a backup of the Hard drive on CDROM. hard drive needs reloading, but without a working floppy drive, I am unable to do it.

Machine is operational, apart from the mentioned floppy (I really should have learned to solder)

Offers please by email. I'm UK based, but will ship anywhere required at buyers cost.

Remove spamnews from address

I suppose there are some wires that need to be re-soldered
because he talks about a 1.44 floppy adapter. Ajax controler
instead of wd1793 I suppose ?

Wires have come loose from the ajax modification, so the floppy is unable to
read disks

If you mean the postings of the same thread listed in a folder bearing
the title of the posting, no Okami can't do this.

Ghostscript however does a much better printing job then Porthos 2.00.
IMHO, Porthos performs very weak at this point. Also the screen output
doesn't look good either. I guess in the future things will be improved
but at this moment I still prefer Ghostscript.

Would'nt disabling logging work? Also, keep the mail boxes as empty as
possible. I keep the lists down to one page and it seems to minimize
spurious files being written and crashes to a minimum!

Ghostscript is OK if you only have 1 or 2 pages per document, but the looooooong wait while it reloads all the fonts for each new page gets me down! Also you can't always jump to a page (for a reprint, say). I agree with Derryck about Porthos' poor screen font, but have had little trouble printing out from it (except if I set the NVDI print dialog to greyscale - sometimes it works, other times nothing prints for some reason!).

Hmm, have you ever tried to load a 150 MB (433 pages with lots of heavy pictures) pdf into Porthos 2,0? On my system this is certainly not possible. Porthos dies with a bus error. With Gemscript no problem whatsoever. I only must pass that pdf through pdf2ps.ttp in order to get access to all the pages.
Under certain condition (I believe with pdf's with imbedded fonts) Porthos really makes a mess of the print job.

TTFN,
Martin

Hi Joseph,

I hate to ask the totally obvious but asking Nima Montaser would probley get you the most direct answer, I think he posted here recently (past couple weeks).

4569. Flatbed Scanner - FREE

Newsgroup: comp.sys.atari.st
Date: 2002-05-25 02:44:36 UTC
From: "Sheldon H. Winick" <s.winick@worldnet.att.net>
Message-ID: <oUCH8.2991$UT.205640@bgtnsc05-news.ops.worldnet.att.net>
Source record: 34622

I'm no longer using the flatbed scanner with my Atari TT030 system, so if anyone would like it and can pick it up in Asheville, NC, you can have it for free. I don't have the shipping carton so please don't ask for it to be shipped -- it must be picked up.

The scanner is a Panasonic FX-RS505 flatbed scanner, which originally sold for around $1200 when it was new (boy, have prices on those things came down!). I'm also including all cabling, the Atari cartridge port interface and ScanSoft scanning software (that bundle cost me another $600 when I bought it).

The system should work with most any Atari ST, STe, Mega or TT030 system, but your really should have at least 2MB of RAM, preferably 4MB, for it to work efficiently.

If anyone is interested, please reply to me at s.winick@worldnet.att.net .

Sheldon

Or e-mail to homa@canada.nl (Nima Montaser). The address is still valid. I
just bought ScanXPRO from him the other day. Paymant thru Paypal - thanx
to my MiNTnet ssl support :-)

And on the same site "FLX work pack" should be useful too for creating FLH.

I dare say that it's to do with the font rendering engine thingy he's using,
since it's obviously restricted to using only a small set of fonts.

I haven't found GS' printing routines to be very reliable, I often get "file
not found" type errors because I can never remember the right order of
incantations ;-)

As we say in England though, "beggars can't be choosers" :-)

Cheers

Indeed. As a result I got an upgrade to ScanX Pro which has removed the bug
that bit when re-scanning the SCSI bus if the scanner wasn't switched on at
boot-up time.

Cheers

Has this bug only just bitten?

What have you added or subtracted from your system to bring this about?

Try running Steffen Engle's SCSIDRV.TOS once before scanning.

Cheers

I haven't stopped working on this little Gfa project, a virtual PG800
programmer for Roland JX8P and MKS-70 Super-JX synthesizers.

Last changes:
- User definable colors when working in 16 or more colors .
(Falcon, TT, etc.)
- Intelligent fileselector routines.
- Simplified, but more effective Tone-name editing. (IMO)

Yes. Your guess is correct. Betatesters please be my guest there.
Especially because I don't have a JX8P or MKS70 myself.

> MagiC users, please speak aloud, I know you have been reading this 'now'
> long thread about magic/cli/gem/gui/sql.
> None of you really dipped in it. Why is that?

Because I'm still trying to figure out how to get STing to work under
MiNT, N.AES, and that thread has ONE reply, which didn't work :/
Why would I want to run STing under MiNT? Simple...at this time it's the
only Stack that looks at my ethernet on an Atari Falcon.

> Are you satisfied with what Dennis Vermeire has to say?

I've missed his post, but from what I've seen before, he's usually pretty
down to earth, with pleads that APPLICATIONS be more thoughtful in not
crying for rescources not found in normal TOS/GEM...unless it's truly needed
for the application to work.

I think a reasonable set of rules for anyone developing a new application
would be to focus in early versions of the software on functionality. Get
the basics of the software down so it works on a plain 1meg ST. Obviously
there are some things where this simply might not be possible, and a
multitasking kernel and more memory will be a REQUIREMENT. However...most
things, with some thought it can be done.

Now...there's a basic version that works under all the variants of TOS/GEM.
Later versions of the application may begin to pick up on features of the
newer AESes and such....that's fine...the plain TOS/GEM user can just go
back to the older versions that work for them.

That sounds fair enough...
And I honestly believe that 'most' developers HAVE done exactly that.
Almost every 'commercial' application I can think of has at least one
version that runs well under plain TOS/GEM. Actually...the only things I've
ever tried to run that cared barked at me, "Must have MiNT installed!"

> Do you consider Dennis the spokesman for you, being MagiC users?

No

> I am just curious, because I know that there are MORE than 1 user (Dennis)
> here using MagiC.
> Yet none of you really said anything, speak up! :)

Unfortunately, I have to use all of them and it's a real pain in the ass.
When I want to work with graphics or get onto my ethernet, I boot MagiC.

When I want to work with pearl and bash scripts and large batch operations I end up booting MiNT. When I want to run CuBase Audio, I boot clean. When I want to deal with large disk partitions (over 2 gig) it's back to MiNT again to take advantage of ext2. It's a bloody night mare that I have to load a different OS depending on what I'd like to get done.

Okay, I'm hopeful about this so called MagiCNet. Somehow I'm in a gap that doesn't upgrade...go figure. I have version 6.01 english, and there's no way to get to 6.2 without buying a new German Version from overseas? Or maybe some kind soul would upgrade it for me, but it'd still have to be done from over seas and I'd have to get some obscure not officially supported english rsc and documentation files from somewhere else...if....I can even find it again.

But then....why bother? I heard that only 'special ports' of the mint net clients and servers work with it anyway. Heh...do we get tools to port them with? What's the point in upgrading? Someday fairly soon I suppose I will....as building a fast lan is of interest to me.

In this respect...MiNT seems a little nicer...it's all in the cvs repository ONLINE. If it's avilable at all, chances are, it's there or it doesn't exist.

I like being able to grab code off the net for certian things, and compile under gcc.
Definately a plus of MiNT. There's a lot of good code out there that compiles under net with one simple command. make

On my Falcon CT2b...
Both MagiC and MiNT/N.AES 2.0 crash ALOT!
I can move stuff around the desk top and think (oh, this is so cool) for hours with no problems. But when I start actually trying to use the thing, I find I better SAVE constantly, and be in a very paitent mood to boot/reboot/tweak/boot/reboot/tweak.

In the contest of 'stability' and things behaving as they should, on my Falcon...MagiC wins hand down. It's faster feeling and freezes/crashes/hangs far less than my current MiNT/N.AES setup. Under MagiC, All the Falcon resolutions work as they should with software like Photoline, PixArt, TrueImage, etc. With both N.AES and XAAES and alot of great graphics software, some resolutions work fine...other's just display garbage.

Why do I bother messing with it?
It's fun sometimes....
And I'm hopeful that someday I can just sit down, turn on the machine, use it, and forget about what OS is running on it. Like my good old Mega ST felt with Notator, KCS Omega, Cubase, etc. I've been very happy with my ST running MIDI apps :) The Falcon to a large degree has been a constant disappointment.
Always 'so close' to working with this 'drool factor of coolness'...but dern when I start actually trying to use it often ends up being a waste of time.

I'd hoped the Falcon would be a step above the ST, in allowing those great MIDI apps to run along side some other basic production tools. Oh well...a good attempt for 1992 ;)

Someday....
There might be one 'something' I can boot, and run a complete SUITE of software
in a single work session to do anything I wanna do without having to reboot a different stinking kernel. So far...there's no such thing for my Falcon given my current library of software.

Brian

4582. Let'em'Fly

Newsgroup: comp.sys.atari.st
Date: 2002-05-25 22:07:01 UTC
From: cstanley@zetnet.co.uk
Message-ID: <3cf00b04$0$29605$4c56ba96@master.news.zetnet.net>
Source record: 34636

Hi, Gang!

1. On a TT I have recently frequently suffered the infamous Error 69
several times, from which I thought I was immune, with MagiC6.01.

This time, I discovered that the effects that "Let'em'Fly" (in AUTO)
provides have disappeared with each "Error 69" (like underlined chars,
use of Undo in (/shame) Yokon card game (/endshame) etc).

So: is this "error 69" due to "let'em'fly" or what?

2. In Protext, and otherwise, the mouse pointer sometimes disappears:
only "mouse-on.prg" will bring it back. Comments?

Regards to all here,
Charles.

PS, for those who know: both my new Hades060 and my Syquest drive have
gone dead-wise, and needed spondulics for repairs are totally absent :)

Cheers, All.

If you were to obtain the DDP translations you'd be able to eMail the team
direct with any problems that you wont be able to find.

I worked with the DDP team and nitpicked profusley before the translations
saw the light of day, you are unlikely to find any problems, so no support
would be needed

The best would be to put it on a website in downloadble form and announce it
on ATARI.ORG (http://www.atari.org/) and in other ST related forums
(as on LGD http://www.atari.st).

Tell others where to find it and it will be found!

I didn't knew that one, thanks.

As binaries forums don't keep the files more thant one month (on my isp) it may not be the best place to release it.

> There is also the Belgian ftp-site chapelie.rma.ac.be

That's a great place (-;

Hi Martin,

Check this out:

http://www.clauss-net.de/atari.html#ocr

It works good and shows all in real time. There is
also a package that is from Migraph who made scan
software for the handscanners. It is reliable but a
little bit out of date. You have to export your
scanned text as a ASCII file and then open it to
chack the result. In OCR from Claus that can be seen
uring the process.

Try his one first...

I don't know about the software on Claus's site, but the Migraph software has the ability to "learn" fonts it doesn't recognize automatically. Also, I discovered that if the font being scanned had thick horizontal components to the letters in relation to the vertical components often caused problems. As a result, an uppercase "D" was often recognized as "I)".

I never used the program much, found out I didn't need OCR all that often. But the letter recognition problem may be partly linked to the resolution of the handscanner I was using. With the higher resolutions available on flatbeds, it may not be a problem. And I seem to remember (too lazy to look in the book at the moment) you may be able to adjust the amount of space the program "looks at" as being the area that a letter takes up.

I keep telling myself I'll put it back on the TT someday, but someday never seems to come. :-)

Ken

Thanx. I downloaded it and it looks and works quite nicely.
It's a shame that Alexander Clauss has left the Atari platform. (?)
CD-Player, CAB, and OCR: He has given us some really nice Atari software.

question. I sometimes read about GDPS drivers. Is there a GDPS driver for
a UMAX 1220s somewhere, and if so, where should I find one ?

A. Clauss's has this also. If it comes across something it doesn't identify
as a known letter/font, it asks you to type which letter it is supposed to
be, or you can tell OCR to ignor it if it is just a stray mark on the page.

It's quite a nice program. It displays the scanned image in a window at the
top part of the screen, and at the bottom displays a text window that shows
in real time what it has recognized and entered as part of the text. Nice,
simple dialogs come up to ask you to identify unrecognized characters. A
fairly elegant piece of software (for its age - it's been out and un-updated
for quite a while now).

Martin,
The s/w you are using (ScanX PRO) is a GDPS scanner driver when
used as an ACC or standalone program under Multitasking OS. So, all
you'd need to do is to use an application that supports direct
scanning via GDPS (such as Photoline, OCR1.4, etc) and then you'd be
all set.

cheers,
Nima

4614. FS: SCSI stuff - HD - cables, Connectors - case , CPUs etc

Newsgroup: comp.sys.atari.st
Date: 2002-05-27 17:47:00 UTC
From: nmontaser@hotmail.com
Message-ID: <e657320c.0205270947.2bbd2d6a@posting.google.com>
Source record: 34567

Hi gang,
I have a whole whack of SCSI stuff for sale. The first to offer me
$40 Or best offer, gets it all. I must warn you, due to the nature of
some of the items, you might end up paying big bucks for the shipping.
It is your choice, you can exclude some of the items from shipping, if
you wish. Shipping is extra.

- Syquest Syjet 1.5GB Removal drive + 2 cartridges. No cable.
- SCSI A/B switch box, 50pin centronix (used to switch between two
SCSI chains, i.e, when sharing between PCs)
- Several high grade SCSI cables, various lenghts, various connectors
(50 pin, 25 pin, etc)

- SCSI Ribbon cable building kit: (used for building either internal
cables, or scsi case connectors)
* 40~50 feet of SCSI ribbon cable
* 34 50pin Male head connectors
* 12 50pin centronix Male connectors

- > 12 3head SCSI internal ribbon cables

- A couple of enclosures for devices. Can house SCSI HDs.

CPUS: (they should be working, they were pulled out from working
systems)
- Several MC68030 PGA processors
- A couple of MC68882 PGA Match Coprocessors

Chips: (for free)
- Dozens of 1MB, 256KB Simms, 80-150 ns, not sure of their state.
- Lots of chips which I have no idea what they are, and what systems
(mac, pc, etc) they were putted out from. You never know, you might
hit a gold mine with them.

Let me know if you are interested, or call me at 613-277-5577

cheers,
Nima

OCR - Optical Character Recognition for all Atari compatibles

Author: Alexander Clauss, Stresemannstr. 44, D-64297 Darmstadt, Germany

Email: aclauss@rbg.informatik.th-darmstadt.de

Download from chapelie.rma.ac.be perhaps? or prehaps InterActive?

It is very good, though has to be taught the font - if you are prepared to do that, you can get a lot done. The font means a particular size and shape of letters. If you have exactly the same page scanned at a different resolution you might have to re-train it. Modern PC ocr programmes are more automatic but often while you can correct errors, the program cannot be taught.

Someone mentioned Migraph. There is also Syntex. Neither are very useable - Syntex might be better than Migraph but needs good clear images.

JI Logan

4618. Atari 520STFM trouble

Newsgroup: comp.sys.atari.st
Date: 2002-05-27 23:29:46 UTC
From: "T.J." <tjskidNOSPAM@libero.it>
Message-ID: <3CF33FD1.CC82F262@libero.it>
Source record: 34572

Hi!

Last weekend I've bought from a friend two STs; a 1040STF, that works well, and a 520STFM, with this problem: when turned on, the 520 shows on screen only some coloured vertical stripes, then freeze.
Anyone have an idea? It could be the ROMs? I'm thinking to change roms from the 1040 to 520 to discover, but first I'd like to know if I could be right :-)

Thanks!

If something is wrong in the 520 then the 520 could damage any 1040 parts
you put in it, (and vice versa, parts from the 520 could damage the 1040
if you took them from the 520 and put them in the 1040 without testing
them first).

I would not do what you suggest.

I am no expert, but I would assume that the first things to test would be
things in the video output circuitry.

Perhaps an old atari book or magazine has hardware trouble shooting
guides. I would read them first before risking damaging the working ST.

wrote:

>You might find that other resolutions which divide equally by 32 (864 etc)
>and set to 4*3 aspect ratio in Videlity also work?

Thanks for the tip, I'll give it a try.

It's strange. I just noticed that when I boot under HD Driver
(Nemesis LO+Videlity) with my current 2-color resolution of 800x600,
the display looks good. However, as I mentioned, CAF is more prone to
crashing under HD Driver on my system (more about this in another
message)...

When I boot under ICD Pro (Nemesis LO+Videlity) with my current
2-color resolution of 800x600, CAF is much less likely to crash, but
the display has some problems - in fact, the problems start at the
desktop, before even launching CAF. Any icon below or to the right of
what the NORMAL screen size would be no longer shows any text label.
The space for the text is there under the icon, just not the text
itself.

For example, I boot under ICD Pro (Nemesis LO+Videlity), to achieve an
800x600 2 color resolution. The trash can icon is located in the
lower right corner of the screen. This puts it in the "extra screen
space" I've added by using Videlity. When it's there, I see no text
under it's icon. If I move it on the desktop within the area that
would be considered the NORMAL Falcon 2-color screen resolution
(without Videlity), the icon text shows.

The same thing is true if I open a drive window and maximize it.
Anything outside of what would be the NORMAL Falcon 2-color screen
resolution shows the icon, but no text under it. When I launch CAF at
this resolution, all the small text labels on the transport bar are
gone, but the program works well.

Any thooughts on this one?

4622. CAF Bombs with HD Driver / not with ICD Pro

Newsgroup: comp.sys.atari.st
Date: 2002-05-28 02:19:36 UTC
From: nurmix@spam-free.com
Message-ID: <3cf2e5d1.13109382@news-server.socal.rr.com>
Source record: 34576

Ok, here's the scenario (Falcon+Nemesis set to LO / HD Driver version 7.61). Note: turning the Nemesis OFF, and/or disabling ALL ACC and AUTO programs makes no difference; the results are still the same.

Normally, I use HD Driver on my Falcon for just about everything; under TOS, MagiC, whatever. It works well, and as it should.

When I run CAF under HD Driver, all the MIDI functions of CAF work, and it's very stable (with or without the Nemesis).

However, when I try to record AUDIO with CAF and HD Driver, that's where the trouble starts...

For example, let's say I want to record in mono on track 3. I select track 3, and open the monitor window, where I click to select a new filename. Of course, I can also simply hit record, at which point CAF will prompt me for a filename.

I name the file, hit or click OK - there's a pause of about 2 seconds, then BOOM... multi-bomb crash to the desktop, where the Falcon is completely locked up.

This happens every time without fail.

So, I boot under ICD Pro 6.5.5 using a floppy with the driver on it (by holding down ALTERNATE during bootup to make the Falcon look to the floppy drive).

I do the exact same thing, but this time, naming the file DOES NOT cause a crash, and CAF functions as it should.

So, why should the hard disk driver I use make any difference? I just can't understand what's causing the multi-bomb crashes under HD Driver. Is it some setting within HD Driver that needs to be changed?

I don't think so. HDDRIVER 8 is known not to work with CAF, at least on some machines, because CAF has its own SCSI code, which is not compliant to the standard. But older versions are known to work fine, e. g. 7.9. Can you please send me your HDDRIVER serial number? I noticed that you are not registered yet with my user database.

>Thanks!

Stripes could be a symptom of a memory problem.

Does this 520STFM have a "memory expansion" installed..?

ROMs do not (or so seldom as to be never) "go bad", so it's probably
not the ROMs.

It COULD be corrosion on the chip legs and socket, or "floating chips"
(the STs are notorious for their chips "creeping" out of their sockets
and causing all kinds of problems).

The FIRST thing to do would be to open up the system and carefully,
but firmly, press all the socketed chips back down into their sockets.

You'll hear a "crunch" as they re-seat.

Be sure to also do this for the Video Shifter chip located inside a
small metal RF shield on the righthand side of the motherboard (not to
be confused with the RF modulator on the backside of the motherboard-
there's nothing inside the modulator that needs to be reseated, so
don't open it up).

If this doesn't fix it, try VERY GENTLY lifting the socketed chips up
out of their sockets SLIGHTLY with a small screwdriver, then press
them back down into the sockets. This will "wipe" the corrosion off
the chip legs and the socket contacts.

Don't however do this with the square "MMU" chip toward the middle of
the motherboard, just push it back down without trying to lift it.

The socket this chip is in can be broken very easily, which will trash
the entire computer.

When you open the system up, if you find a loose printed circuit board floating around inside the case with a bunch of wires going to the main motherboard, you've probably got a "memory upgrade", and this is probably the source of the problems. You'll have to try VERY GENTLY to re-seat all the connections and socketed chips on the memory expansion board.

Are the bars stationary? Or do they move?

> Anyone have an idea? It could be the ROMs?

It could but ROMS, but they are one of the simplest component in an ST,
and not something that has a reputation for failing. If they are true ROMS
then they would be very low on my list of suspect devices. If they are
E-Prom
then possibly. I certainly would not mess with a good Atari to try and fix
a broken one. They are just too delicate, and too easy to damage.

>I'm thinking to change roms
> from the 1040 to 520 to discover, but first I'd like to know if I could
> be right :-)

I would not try this. It is very unlikley to be correct. If the ST has not
been used for some time, and stored in a high humidity environment,
or even some where where there are large ranges of temperature change
then it could be that a socketed IC (including a ROM) is not making
perfect contact, and the first thing I would try is reseating the ICs in
their sockets
after taking proper electrstatic precautions.

If that does not cure it then you are really down to real diagnoistics which
are outside the scope of this group. Bad memory (RAM not ROM) would
be next on my list of suspect areas, but to test you would need a diagnostic
cartridge, and if the RAM is as bad as I suspect then that would not work
either.

Any way I see BEST Electronics

http://www.best-electronics-ca.com/520_1040.htm

list the service manuals at $40.00 and the Diagnostic Cartridge at $39.00,
but I guess you could get a good ST from E Bay for that (assuming your are
in
the US but your headers seem to indicate Italy).

4627. Printing to file in NVDI

Newsgroup: comp.sys.atari.st
Date: 2002-05-28 09:39:30 UTC
From: <>
Message-ID: <1022571766-153444AEicMi@ntlworld.com>

Hi all,

I've just tried Samba/Magxnet to print a file on a printer on my laptop PC, connected to my Falcon by Ethernet.

The routine actually works very well, but the result (a colour graphic) was over-inked.

Has anyone any experience of printing NVDI print-files on a PC? Do all the settings for print quality/paper type/brightness/contrast from the printer control panel get embedded into the file produced by NVDI, since there's obviously going to be a problem with the printer driver on the PC end introducing its own settings?

Cheers

Derryck

Nice list of links Tim ! I will put some of those links on my YSEDITOR page, if you don't mind. Note: All the sounds in Tim's list that are for 4-OP FM synths (not the DX-7 ones) can be loaded into one of the YSEDITOR versions (Plus, V50, or FB01 version).

If you come across a fileformat in the list that YSEDITOR can't handle, please let me know and I will try to make YSEDITOR recognize that format too.

The THiNG desktop has the possibility to do this in it's "install application" options menu. This is especially usefull when using some old pre-multitasking apps under Multitasking. But I don't recommend running Notator or Cubase under a multitasking OS.

That's really wierd. Do you have NVDI installed, and if so, does it run
before or after Videlity? The screen size doesn't seem to be being reported
correctly.

You might also try the Centek version of Videlity. It doesn't work at all
well with my CT2 whereas Videlity is fine.

Here's where the experts are:)

I have a SCSILINK connected to a Falcon utilizing Anodynes
scsilink.stx driver.
The ethernet connection is provided by a Linksys 4 port cable modem
router, which is in turn connected to a cable modem.
As far as I can tell, the Falcon is properly connected to the LAN, and
can Ping the router, print server and two other PC's on the network,
and can ping the Falcon/SCSILINK from those machines. I can not ping
outside the LAN however.

I'm still not 50% confident in my settings of STinG, and not sure if I
am missing something in the setup. I ran an HTTP client on my XP
machine, and tried to access the port from the Falcon using CAB, but
it couldn't find or resolve the address. I can ping the IP/port that
the router is forwarding the HTTP request to, CAB just cannot access
the html page.

It seems that I might be having problems with resolve, and would like
to see how someone else has theirs setup, ie, what STX files other
then scsilink.stx are needed by STinG, what their route.tab looks
like, if dial.cfg is needed and what settings to use in that file, and
just the values in general for an ethernet connection.
TIA,
Mike

Can any Eclipse & FVDI users explain the following.

Should I wish to print out when using Papyrus 5.15 the Print via TOS needs to be enabled other wise the print is sent to the screen other than output to the connected printer.

Auto set up in this order Magxboot, xboot, extendos, PCI_BIOS, FVDI, NVDI & Xgem

On my set up have never managed to get NVDI 5.03 to boot before FVDI

thanks

Thomas

This sounds like you have routing or proxy set incorrectly.
What is in your c:\sting\route.tab file ?
What proxy settings do you have in CAB ?

I am not sure what you are saying here. Can you explain in more detail.
Also try doing "nslookup" on the address on the XP machine and then
a "traceroute" on both the Falcon and the XP machine.

Check out http://dwade.freeserve.co.uk/dwade/atari/main.html
Its for the Cartridge Port Ethernet card, but as far as I can tell
the only difference between using that and the Anodyne is that
I have a enec.stx and you have scsilink.stx for the card driver.
You should not need dial.cfg or any such things.

If you want to save memory, why do you want to limit the memory ?
Sounds like a contradiction to me. I think LIMITMEM.TTP makes a program
believe that the computer has less memory, say 520 KB, than it really has,
for example 4 MB. (Correct me if I'm wrong)

This is really more a JX8P problem than a problem with the SysEx apps.
The SysEx specs of the JX8P don't allow sending or receiving a complete
bank, only single patches. Maybe it is possible with a sequence of Program
changes in combination with tone dumps. If it is possible I must have used
this possibility when I made a device adaptor for UNI_MAN. That was some
time ago, I'll take a look at it. I also have another old JX8P edit
program somewhere in my shoeboxes with Atari floppies. I'll see if I can
find it.

Sure Uwe, and thanks for the quick response.

I bought it several years ago from Systems For Tomorrow (if memory
serves). The serial number on the original floppy is 44021570. As I
mentioned, it's version 7.61.

Other than the problems with CAF, it works great. Can you suggest any
settings I might play with to make it more compatible/stable with CAF?

My reply, PART 2.

In my JX-8p adaptor for UNI_MAN it is possible to load single tones from disk in a bank, and then send the complete bank to the JX8P as a whole. But this loading of all these little files to create a complete bank in UNI_MAN still has to be done by hand.

I also found this old JX-8p editor/bankloader. It's in German, it's quite old and primitive, but it might work. I can mail it to you if you're interested.

4645. AHDI and Partitions

Newsgroup: comp.sys.atari.st
Date: 2002-05-28 22:45:15 UTC
From: nurmix@spam-free.com
Message-ID: <3cf4003e.14920725@news-server.socal.rr.com>
Source record: 34592

Well, I did some experiments with AHDI and CAF yesterday. Up to this point, I had only used either HD Driver or ICD Pro. I created a boot floppy with all the necessary files for AHDI [with AHDI.PRG in the floppy's AUTO folder], which correctly loads the driver from the floppy (when holding ALTERNATE during bootup to force the Falcon to look to the floppy drive instead of drive C:).

During my CAF tests, everything seemed to work well. As I have mentioned in previous posts, CAF will crash with HD Driver when trying to record audio. And under ICD Pro, it runs fairly stable, but there are other problems.

I think AHDI might _finally_ be the solution to my CAF crashing/stability problems. The only thing is, I'm not very familiar with it or it's limitations. And the main problem is that it's not recognizing all of my partitions, which I assume is just a limitation of the driver itself?

Here's the rundown of my Falcon drives:

[C] is my boot drive - the built-in 85MB IDE drive

Then, I have a 4.3gig SeaGate Barracuda drive for [D] through [M]:

[D] is a 349MB empty partition used for audio recording
[E] is a 349MB partition for "Applications"
[F] is a 349MB partition for "Utilities"
[G] is a 349MB empty partition used for audio recording
[H] is a 349MB partition for "Graphics & data"
[I] is a 349MB empty partition used for audio recording
[J] is a 244MB partition for miscellaneous storage
[K] is a 799MB empty partition used for audio recording
[L] is a 799MB empty partition used for audio recording
[M] is a 349MB partition for "MIDI & Music" programs

[N] is my SyQuest EZ Flyer 230

[O] is my Pioneer CD ROM drive
[P] is my Yamaha CD-RW drive

AHDI only recognizes drives [C:] through [H:] (however, even though it "sees" [H], the drive can't be opened). Is there some way to make it recognize any of the other partitions, or is that all it will handle? Both ICD Pro and HD Driver recognize all of them.

If there is no work around, I can always rearrange my drive so that there will be more space available for audio recording when booting under AHDI. As it is now, it _will_ work, since the [D] and [G] partitions are both available for audio recording. But this would limit the amount I could record in any one session with CAF (not a big deal actually). The only other drawback is that I had to copy CAF itself over to [E] since it's original drive [M] was not available.

Any help or suggestions would be appreciated!

Hallvard,

I think I've come up with an 'elegant' solution to your (and MY) problem. The explanation takes a while, but once you're done, it's very easy, I promise!
;-)

I too have recently found the need to boot with AHDI when running Cubase Audio (only when I need to do audio recording). Normally, I boot under HD Driver for just about everything. And Cubase Audio _does_ work ok under HD Driver, if I'm _just_ using the MIDI portion of the software. But as you've no doubt seen in some of my recent posts, I have crashing problems with it when I try to record audio after booting under HD Driver.

In the past, I was booting under ICD Pro (from a floppy - with the driver in the AUTO folder of the floppy). This allowed me to record audio without crashing. Well, it still occasionally crashed, but not as much as it did under HD Driver. However, many people told me to try AHDI, as it was bare-bones and best for use with CAF (and SoundPool's Audio Tracker too).

I too was having the problem you were though. I could boot ok from the floppy, AHDI would load, and AUTO programs would also load from floppy. But, like you noticed, ACC programs (which in general, are a bad idea when running CAF!) would load from drive [C], as would the NEWDESK.INF from drive [C] - although I have more to say on this at the end of the explanation*.

So, here's what I did...

First off, create your AHDI boot floppy, with AHDI.PRG in the floppy's AUTO folder, and any other AUTO programs you might want also in the floppy's AUTO folder.

Now, you need to be using some sort of boot manager for this to work right. I use X-Boot, and I'm sure if you don't have that, you've got something similar.

As you no doubt know, X-Boot allows you to configure different "sets" - which allow for various boot setups. One for graphics work, one for MagiC, one for MIDI work, etc. Well, as I'm sure you also know, X-Boot allows you to create and use numerous different NEWDESK.INF files. I have about 20 (in a folder on my [C] partition called "DESKTOPS"), all named based on what boot "set" I'm going to use them with - ie. "MIDI.INF", "16COLOR.INF", "256COLOR.INF", etc.

In X-Boot, each individual "set" can have it's own NEWDESK.INF file assigned to it. When booting, X-Boot takes this custom NEWDESK.INF file, and writes it to the root of [C], over-writing any old NEWDESK.INF file that was there.

Bare with me here. A little bit of preparation is needed to get it all to come together and work...
;-)

First off, I did a normal HD Driver bootup to a 2 color desktop, and created the desktop that I'll want to see when booting from floppy [later] with AHDI. In this case, just a simple 2 color desktop, with an icon for CAF, and the drive icons I'll use for audio recording.

I then do a "SAVE DESKTOP", which writes the NEWDESK.INF file to the root of [C]. Then, I immediately copy _that_ NEWDESK.INF file from [C] to the root directory of my boot floppy. I also copy it to the folder in drive [C] where I store all of my other variations of NEWDESK.INF files for X-Boot to utilize. I then re-named the one in my "DESKTOPS" folder to "NOTHING.INF".

Next, reboot under HD Driver, and create a new "set" in X-Boot, with _no_ AUTO programs, _no_ ACCs, and _no_ CPXs. I named the set "nothing". And I configure this "set" to use the "NOTHING.INF" [newdesk.inf] file. and save the set.

Now, whenver, you want to boot from your floppy to AHDI, and you DON'T want any other ACCs to load, but you ALSO want to correct NEWDESK.INF file to load, you first do a normal HD Driver bootup to X-Boot, choose the "nothing" set, and let if boot. Now, once booted your "NOTHING.INF [newdesk.inf] file has just been written to the root of [C] by X-Boot, and X-Boot has also renamed all ACC extensions to .ACX, making them inactive.

Now you're ready to do a floppy/AHDI boot...

Obviously, make sure your AHDI boot floppy is in drive [A], and simply do a cold boot/reset, and when you see the Atari logo (bypass memory test if needed - I have mine disabled but you might not), hold ALTERNATE to force the Falcon to boot from floppy. AHDI will load, as will any AUTO programs from the AUTO folder of your boot floppy, and when you get to the desktop, the correct NEWDESK.INF file will have been loaded from [C] but no ACCs, because remember, your previous 'clean boot' under HD Driver using your "nothing" set from X-Boot disabled all of them!

That's basically it!

To reiterate: from now on, when you want to do an AHDI/floppy boot, simply FIRST do a normal boot with HD Driver, load your "nothing" X-Boot "set". Once it's done booting, re-boot from your floppy.

*Regarding _also_ copying the NEWDESK.INF file to [A]. I _think_ you're partially right about the NEWDESK.INF file being read from [C] when booting from floppy. But if I don't ALSO have that same NEWDESK.INF file I use for my "nothing" boot "set" from X-Boot on my floppy, it doesn't seem to work right. It's as if the Falcon reads the NEWDESK.INF file from _both_ [A] and [C]. I'm not 100% sure what it's doing, but as long as you follow my directions here, it WILL work.

AHDI does not support SCSI drives larger than 1 GByte. AHDI only
recognizes the first GByte of a SCSI drive.

> for example 4 MB. (Correct me if I'm wrong)

Every program you run gets ALL avialible memory at startup. This was ok for SingleTOS, but it is not proper for multitasking purposes. That is why modern applications just free that memory after starup. Other (older) programs that do not do this must have some restrictions. Thist is why some form memory limitation is implemented. If I understand the idea correctly, memory is limited only on startup (program does not get whole memory but only the ammount we are limiting it) but after startup it can malloc more memory (exdending the limit).

Hi Joseph,
I had the same problem. You need FLXIFAST.PRG. It will set all bits
that are possible to set to "fast" or "slow". Send me an E-mail (my above
address is good) and I'll send the program to you.
Regards,
John G.

4657. Symbolic Composer Atari released as shareware

Newsgroup: comp.sys.atari.st
Date: 2002-05-29 12:53:41 UTC
From: Trond Einar Garmo <trond.einar.garmo@hf.ntnu.no>
Message-ID: <3CF4CF55.3170D88@hf.ntnu.no>
Source record: 34508
Body handling: Binary attachment payload not displayed: trond.einar.garmo.vcf

Hi.

Symbolic Composer, Atari version 2.01 is now released as shareware. This version is especially prepared to run in Windows (or Linux?) under the Steem Atari emulator.

It is downloadable from the Symbolic Composer homepage (shareware price is 39.95 EUROS):

http://www.mracpublishing.com/download_00.html

In addition to asking the author if he would release the program I have done two-three things:

1) Prepared the complete manual as a Windows Help-file. The printout of this helpfile was then converted to PDF, so you have both options. (The PDF-file looks ugly and is very big.)

2) I made a KCS-to-SCOM spreadsheet in Microsoft Excel. This analyzes and converts the printout from KCS tracks (via Steem) to Symbolic Composer symbols.

3) I made some files for the Windows Text editor TextPad. (Plus I wrote some readmefiles about how to set up the program in Steem.)

My files was made to run Symbolic Composer smoothly in Windows under Steem, so Atari only users won't benefit from them. But the complete program in it's latest version is there for you anyway.

What is Symbolic Composer?
This program is in my opinion the most comprehensive composing environment ever written. It was developed on the Atari from 1987 to 1996, but was ported to the Mac in the beginning of the 90's. The Macversion has a much nicer user interface with menus etc. and is a quite different beast today, but the main set of functions are the same for both programs. A PC version is in the works also, but the project has been delayed a few years.

Symbolic Composer is a LISP based programming language. It kind oflives on top of LISP, although LISP functions can also be used directly in the source code. When you have written your sourcefile the LISP interpreter/compiler compiles standard MIDI-files. In the Atari version these files must be edited in a sequencer to add MIDI channels, programs, controllers etc. The best environment for the compiler and text editor is Dr. T's KCS sequencer with MPE, although both Cubase with MROS and Notator with Softlink can be used (on Atari's - in Steem only

KCS can be used, and on PC's any Windows sequencer can be used, of course).

The program takes some time to learn fluently, but the package comes with good tutorials and quite many example files in a number of styles - rock, jazzrock, new age, electroacoustic and C20 classicalstyle compositions. I would highly recommend this program, despite the (lack of) user interface and steep learning curve. (For Steem users it looks a bit nicer, especially if you run the recommended setup with TextPad.)

I do not see why C2000 would not run on the falcon.
This program, if I remember well, was runing both
in 320x200x16 color mode, and monochrome, and except
digi sound does not do anything particularly tricky.

Hi Adam-

There is a chess-war game called "Medieval". It's played with joysticks. 2 players, or 1 player against computer. It's a little different than "normal" chess in that you don't automatically win a battle when your piece outranks your opponent. You still have to do battle, and injuries are carried with that piece into it's next battle, but will eventually heal. It's pretty fun, and rather humorous. If you're looking for a serious tournament-level game, this might not be what you're looking for.

I have a Falcon with Nemesis, and it runs fine on it. I can't remember if I needed to slow it down or turn off any caches. I have a CPX module for my Nemesis that allows me to set it at 24, 20, 16, or 8 mhz, and to turn off the data and instruction caches. Maybe that CPX would work for the caches even without having Nemesis installed? If not, I'm sure there are others.

Hope that helps,

Clayton Murray

I got my registration for ACE MIDI and tried to login on the ACE MIDI website, http://newbeat.atari.org. But my login was rejected. I tried both with CAB and Lynx using MiNTnet. Both the same problem.

Then I tried again, but now using Dan Ackermans CAB.OVL, after running gluestik I could now suddenly login with CAB and my password on the newbeat website without problems.

Can anyone explain ?

Martin Tarenskeen

p.s. ACE is great !

Yes, I'm running NVDI, and it loads before Videlity. This 'weirdness'
only happens when I boot under ICD Pro, _not_ HD Driver or AHDI.

>You might also try the Centek version of Videlity. It doesn't work at all

Yes, to the best of my knowledge it does. It also has the Nemesis
accellerator installed (and the person who installed it told me the
clock patch _had_ been done).

I've done more testing with ICD Pro, HD Driver, and AHDI. CAF seems
to run best with AHDI so far.

Try CAF_FIX from the HDDRIVER distribution. The Falcon's bad SCSI/DMA
hardware is still the best guess for the source of your problems, in
particular because others users do not observe the same problems.

4673. [UPD] from june of Eureka :-)

Newsgroup: comp.sys.atari.st
Date: 2002-05-30 12:21:25 UTC
From: lecoat@atari.org
Message-ID: <e895cb13.0205300421.5cb324d4@posting.google.com>
Source record: 34526

Hi all,

I have uploaded the june release of Eureka on my WEB page.
My software is a 2D Graph Describer and a 3D Modeller. About
news, I can tell that the compatibility of POV 3.1 export
is now good when using POV 3.5. The LDG screen driver is
now better handled, and more compatible with some platforms.
I can say that Tos2Win is now OK, though it was very tricky
since then. The RAM is also better managed. Thanks to that,
I could run Eureka + OpenGl in 4Mb of memory on my Falcon
and MagiC Mac demo. These are my references about a minimal
configuration. Of course, without OpenGl, Eureka should
work in 1Mb of memory (can anyone tell me more ?). I also
performed some optimizations in speed. Shortly, I strongly
recommend it to you ! Any comment is welcomed.

So, see you soon for updated news of ATARI front-line ...

> What proxy settings do you have in CAB ?

192.168.1.1 (router) 255.255.255.0 Ethernet0 0.0.0.0
0.0.0.0 255.255.255.0. Ethernet0 0.0.0.0

Tried no proxy setting in CAB and tried the 192.168.1.1 as a proxy
server also.
Have also tried using the PC as a gateway "192.168.1.4" server for the
Falcon.

>

Falcon IP 192.168.1.5
Router IP 192.168.1.1

I have a mini "Webserver" running on the XP machine.
The Linksys cablemodem router is set to direct any incoming port 80

request
to the PC.
The Falcon can ping 192.168.1.4 (PC), but resolve cannot find the
address,
even if only the IP number is being used. It still trys to resolve
it????
I tried an FTP client, and it reports that STinG cannot resolve the
address.
nslookup from XP box shows Falcon IP of 192.168.1.5
traceroute works from both machines.

> Check out http://dwade.freeserve.co.uk/dwade/atari/main.html

Link doesn't work

> Its for the Cartridge Port Ethernet card, but as far as I can tell
> the only difference between using that and the Anodyne is that
> I have a enec.stx and you have scsilink.stx for the card driver.
> You should not need dial.cfg or any such things.

Some of the settings in dial.cfg must be required for STinG as it
won't work without them.

Have tried DNS server from the ISP
Have tried the router as the DNS server

Ping works
Traceroute works
resolve does not
DHCP on the cablemodem router is disabled

Thanks,
Mike

On a similar topic as another thread, I thought I'd heard that PageStream is one of those programs that tries to grab as much of your system's memory as possible while loading (please correct me if I'm wrong on that). For example, on my old ST, it loaded almost instantly. When I first got my Falcon, it had 4Mb and took a while longer to load. I got a 14Mb memory card, and now it takes an eternity in comparison. What if memory for this program was limited to say 2Mb? I'll have to try this and see. I don't really use PageStream all that much anymore.

That is really odd as I do not have : -

1. A dialer directory of my "C" drive
2. Do not have any of the dialer software loaded
3 And as far as I can tell do not have a dial.cfg any where.
(there is a dialer.inf in d:\sting\sting126\dialer but I don't see
that sting would find that)

>
> Have tried DNS server from the ISP

So it does looks like a resolve problem.
What are you entering as the host name and what are you expecting
to do the DNS lookup?

> Thanks,
> Mike

And please excuse very incomplete reply. Not feeling too well tonight,
so not diagnosing 100%

Dave.

>what you mean.

All drivers of pagestream are little programs.
I think Neodesk only set fastload for the main program, not for the
drivers.
Just find a program to set fastload bit on all drivers and pagestream
will load faster.

I have Gnu Chess 4.00pl.62 with GEM version 0.9 from Warwick Allison
here and this version works perfect on my Afterburner Falcon with NOVA
graphic card. No cache problems.

Btw: Is there a newer Atari port of Gnu Chess anywhere?

news:<ad0p41$v7a$1@newsg2.svr.pol.co.uk>...

Finally got to see a webpage on the Falcon ethernet setup. I purchased
a crossover ethernet cable and just tied it to the PC directly and
accessed the mini webserver on the local XP machine. I didn't try to
set the PC up as a gateway yet to try WAN internet access. The STinG
configuration I was using works there after changing the PC's IP to
the one the router had.

Initial transfer starts out at about 175Kb/sec but before the complete
page is displayed, rate drops to about 230b/s.

With the router out of the loop, I guess I can try to optomize the
STinG settings before going back. It's to slow as it is now, which may
have been some of the trouble in the first place, STinG timing out
before any data was received.

Mike

Message-ID: <3cf6a32cbc4230@go2.pl>
Source record: 34535

Hi!

Have you ever wondered who were you in your past life?
Now you have the chance to check it out with your
Atari-compatible computer. Just enter the day, month
and year when you were born in THIS life, and my prg
will tell you who you were in your PREVIOUS life.

The original version has been written by Natalie V. Zubar.
I have only made the Atari version. It works with all Ataris,
but 640x400 display is needed (so use ST-HIGH on STs).
It is a GEM program of course.

You may find it at http://gregory.atari.pl/pastlife.htm

So have fun with the secret esoteric wisdom ;-)))

Francois,

You know what would be really awesome?

Some screenshots of your application on your page.
Maybe a screenshot based simple tutorial also would be really nice.
If you can't store pictures on your www server (not enough room) I can
provide you some if needed.
If you don't have time to take the screenshots. Could someone else who
knows how to use Eureka create a simple tutorial (screenshot) based?
Ala Blender tutorial for example.

Programers: I am still surprise to see how many programs come out and yet
no real description and/or screenshots to see how the app is supposed to
look.

Lonny, Atarirc page could use some pictures too, that would be nice.

Anyway, just a suggestion :)

Hi All

Just got back from vacation and looks like Trond (of the Atari-MIDI
forum)
was busy and got the Atari version of Symbolic Composer released as
Shareware.!! You can use it on a PC under the Atari emulator called
Steem

http://tamw.atari-users.net/steem.htm

This was a very expensive package when it came out, so very thankful
for
Trond in getting it released. It is a 6 Meg download however.Lots of
stuff.

SC is a Musical Algorithmic Language which can yeild some very
interesting
results once you get past the learning curve. Thanks to Trond for
getting it released!

Anyone ever heard of this package?

MAny Lasers seem to need the full spec printer cable. Injets
work with only a minimal of conenctions.

>Can anybody explain this behaviour and whether one can do
>something in order to get such a printer properly connected to
>a TT?

I don't know, but I guess the TT port is very similar to the ST?
I can't think of any way to get some extra control signals that
were not present on the ST port. The Epson GT scanners could be
used on STs with an extra lead plugged into the midi port, or
was it joystick. Can not remember, but even if these extra
signals could be made I think software would need patching?

Why keep on resending the _same_ message on a weekly basis?
And furthermore, why also _crosspost_ it to several newsgroups?

I think that you made yourself heard by now.

Regards,

Joakim

Well, did you saw my homepage ? I explained that it is decorated with
Eureka. And it is true. Almost all the graphic contents comes from Eureka.
The graphic interface is very poor, compared with graphics that can be
done with the software. My software is much better illustrated with
my homepage than whatever screenshots.

> Maybe a screenshot based simple tutorial also would be really nice.

If screenshots are done for a tutorial, then yes, it becomes interesting.
But, you know, the Eureka documentation is very brief, but it contains
snapshots. Well, at least the english part of the manual ...

> If you can't store pictures on your www server (not enough room) I can
> provide you some if needed.

That's kind of you.

> If you don't have time to take the screenshots. Could someone else who
> knows how to use Eureka create a simple tutorial (screenshot) based?
> Ala Blender tutorial for example.

Yes, that would be definitely great !

> Programers: I am still surprise to see how many programs come out and yet

> look.

Well, by lack of time I suppose. That's my case.

> Lonny, Atarirc page could use some pictures too, that would be nice.
> Anyway, just a suggestion :)

You're welcome :-)

Bye for now ...

Is it possible to use a MegaST keyboard
in place of a TT keyboard. Whats the
difference (if any?).

!!!!!!!
Have WAN access now! Now to get details from the ISP for POP and SMTP
:)
Speeds up to 170kb/sec, but SCSI resets on large images/files. Changed
program flags for all STinG applications and modules to run in ST RAM
(as opposed to Alternate Ram). That settled down the system, but
transfer speeds dropped to ~40kb/sec-1kb/sec. Will work on more DMA
snooping to find problem. Will post details of setup soon.
Thanks for your help,
Mike

They're compatible, but look and feel different. I prefer the TT/MSTE
keyboard myself.

I remember seeing just such a setup a few years ago at an atari show in canada, I think it was Sam Mesbah (sp?) who had it. It worked quite fine and he said he preferred the feel of the keyboard. Me, I still like my regular TT keyboard.

Some people prefer the MST kbd and some TT. It's just a matter of opinion.
I've had both and to me the MST one feels nicer. They are totally
cross-compatible, in fact, early demo versions of the TT had MST kbds...

Joshua.

4700. Problems using HP 2200D with a TT

Newsgroup: comp.sys.atari.st
Date: 2002-05-31 17:44:57 UTC
From: Uwe Seimet <us@seimet.de>
Message-ID: <3CF7B699.7080406@seimet.de>
Source record: 34453

Hi,

I cannot get an HP 2200D printer to work with my TT and I suspect it has
something to do with the TT not having a bidirectional parallel port.
When sending data to the printer everything looks OK from the Atari's
point of view, so sending the data is possible and does not block. The
printer, however, does not print anything and the LED's indicate it is
not receiving any data.
The same printer works fine with a Linux PC, but it did not work with a
parallel printer cable that was manufactured about 10 years ago. I
needed a new, bidirectional cable to get the Linux PC working with this
printer.
Can anybody explain this behaviour and whether one can do something in
order to get such a printer properly connected to a TT?

Best regards, Uwe

I think they are about the same, If I had a Mega ST KB I'd try it out on my TT
to make sure.

Yes I've tried that. Unfortunately, running CAF_FIX makes no
difference. As soon as I select a filename for recording to any given
track in CAF, it's always the same multi-bomb crash to the desktop.

But as I mentioned, under AHDI, everything seems to be working well
now - with the exception of not having access to all of my partitions
due to AHDI's limitations. But I can work around that.

I'm Running MagiCPC 1.01 on an Athlon XP 1.4 under WinXP. Runs fine. I
think the hardware is less of an issue compared to the Host OS like Win XP or
Win2000.
